

Iconizer: A Framework to Identify and Create Effective Representations for Visual Information Encoding

Supriya Garg, Tamara Berg, Klaus Mueller

Computer Science
Visual Analytics and Imaging (VAI) Lab
Stony Brook University

Icon algebra [Kovalerchuk et al.]

- visual language

Semanticons [Setlur et al.]

- create file icons by abstracting terms occurring in the file name

Photo collages [Rother et al.]

- automatic creation of collages from image collections

Photo Clip Art [Lalonde et al.]

- insert photo-realistic objects into new images

Annotate text with 3D renderings [Coyne et al , Götze et al., Götzelmann et al.]

- example: Word-Eye

Story-Picturing-Engine [Joshi et al.]

- index image search engines with exact lexical terms in the text
- no semantic interpretation, integration, or visual abstraction

The Power of Visual Representations

Visualization is an efficient way to communicate information

- how much information can we pack into a visual 'byte'?

The Power of Visual Representations

Visualization is an efficient way to communicate information

- how much information can we pack into a visual 'byte'?

A picture is worth a 1,000 words

- why is that?

The Power of Visual Representations

Visualization is an efficient way to communicate information

- how much information can we pack into a visual 'byte'?

A picture is worth a 1,000 words

- why is that?

A picture indexes higher level brain structures

- triggers information retrieval from previously learned concepts
- daily life, experiences, memories, fears, pleasures, ...
- *iconifies* this information

The Power of Visual Representations

Visualization is an efficient way to communicate information

- how much information can we pack into a visual 'byte'?

A picture is worth a 1,000 words

- why is that?

A picture indexes higher level brain structures

- triggers information retrieval from previously learned concepts
- daily life, experiences, memories, fears, pleasures, ...
- *iconifies* this information

Types of Icons: Pictograms

Used in all aspects of daily life

- traffic, social, computers, ...

Types of Icons: Pictograms

Used in all aspects of daily life

- traffic, social, computers, ...

Convey their meaning through pictorial resemblance to a physical object, action, or consequences of an action

Types of Icons: Pictograms

Used in all aspects of daily life

- traffic, social, computers, ...

Convey their meaning through pictorial resemblance to a physical object, action, or consequences of an action

Pictograms can tell a story by composition

Types of Icons: Pictograms

Used in all aspects of daily life

- traffic, social, computers, ...

Convey their meaning through pictorial resemblance to a physical object, action, or consequences of an action

Pictograms can tell a story by composition

Should be simple and universally understood

Types of Icons: Symbols

Must be learned

爱

Types of Icons: Symbols

Must be learned

爱

Different emotions/feelings may be associated with these

Types of Icons: Real Life Images

May elicit different responses

- depending on culture, experience, professions, mindset, ...

Types of Icons: Real Life Images

May elicit different responses

- depending on culture, experience, professions, mindset, ...

Storytelling with Icons

A picture is worth 1,000 words

- a blessing and a curse
- which information is relevant/irrelevant or ambiguous?
- can lead to information overload

Storytelling with Icons

Storytelling with Icons

A picture is worth 1,000 words

- find dominant set of attributes that most can agree on

freedom

strength

fun

young

SUV

gas guzzler

off-road

uncomfortable

Strategy: First Attempt

How to find that dominant set of attributes?

- use internet image databases (Google Image, Flickr, ...)

Strategy: First Attempt

How to find that dominant set of attributes?

- use internet image databases (Google Image, Flickr, ...)

Why is the internet a powerful resource?

- it gauges public opinion and consensus
- in some ways represents a huge user study
- just type in desired concept and pick the majority

Strategy: First Attempt

How to find that dominant set of attributes?

- use internet image databases (Google Image, Flickr, ...)

Why is the internet a powerful resource?

- it gauges public opinion and consensus
- in some ways represents a huge user study
- just type in desired concept and pick the majority

Problems with this approach

- lots of unwanted images (polysemy)
→ content-based image retrieval (CBIR) is largely an unsolved problem
- so it will not be that easy
- in fact, finding good visual representations for concepts is a 'commonsense' problem
- so is there any hope?

Polysemy: Observations and Outlook

'Gas guzzler' has more consensus than travel

- could use image clustering to find majority vote

Polysemy: Observations and Outlook

'Gas guzzler' has more consensus than travel

- could use image clustering to find majority vote

'Travel' has no consensus at all

- clustering will not yield a strong majority
- we say that 'travel' does not have good *iconicity*

Polysemy: Observations and Outlook

'Gas guzzler' has more consensus than travel

- could use image clustering to find majority vote

'Travel' has no consensus at all

- clustering will not yield a strong majority
- we say that 'travel' does not have good *iconicity*

What next?

- use textual databases in conjunction to image databases
- Lexical Freenet, Wordnet, Basic English, ...
- encode the semantics better than CBIR (at least so far)
- synonyms, specializations, generalizations, co-occurrences

Polysemy: Observations and Outlook

'Gas guzzler' has more consensus than travel

- could use image clustering to find majority vote

'Travel' has no consensus at all

- clustering will not yield a strong majority
- we say that 'travel' does not have good *iconicity*

What next?

- use textual databases in conjunction to image databases
- Lexical Freenet, Wordnet, Basic English, ...
- encode the semantics better than CBIR (at least so far)
- synonyms, specializations, generalizations, co-occurrences

Introduce the idea of *Iconicity Bridge (I-Bridge)*

- uses textual commonsense to move the concept closer to something tangible for which a good icon can be found
→ object, substance, container, person, or some visual action

Iconicity Bridge (I-Bridge)

Links in textual databases

- relations found by word co-occurrences in millions of text documents on the web

Links in textual databases

- relations found by word co-occurrences in millions of text documents on the web

Utility or helper terms

- 'gear', 'device', 'supplies'
- these are combined with the original term

Links in textual databases

- relations found by word co-occurrences in millions of text documents on the web

Utility or helper terms

- 'gear', 'device', 'supplies'
- these are combined with the original term

Test resulting images with majority clustering

- co-cluster with textual terms
- consensus yields one or more prominent image clusters
- pick the center of the largest cluster
→ icon

Clustering: Some More Detail

We focus mainly on shapes

- determine edges using Canny edge detector

Clustering: Some More Detail

We focus mainly on shapes

- determine edges using Canny edge detector

Encode shape via an edge-based feature descriptor

- Gist [Torralba et al. '03]
- Shape Context [Belongie and Malik '00]

Clustering: Some More Detail

We focus mainly on shapes

- determine edges using Canny edge detector

Encode shape via an edge-based feature descriptor

- Gist [Torralba et al. '03]
- Shape Context [Belongie and Malik '00]

Gist:

- oriented edge responses at multiple scales within patches
- used 6 oriented edge responses, 5 scales, 4x4 spatial resolution

Clustering: Some More Detail

We focus mainly on shapes

- determine edges using Canny edge detector

Encode shape via an edge-based feature descriptor

- Gist [Torralba et al. '03]
- Shape Context [Belongie and Malik '00]

Gist:

- oriented edge responses at multiple scales within patches
- used 6 oriented edge responses, 5 scales, 4x4 spatial resolution

Shape Context:

- finds edge orientation histograms in a circular neighborhood
- used similar parameters than for Gist

Clustering: Some More Detail

We focus mainly on shapes

- determine edges using Canny edge detector

Encode shape via an edge-based feature descriptor

- Gist [Torralba et al. '03]
- Shape Context [Belongie and Malik '00]

Gist:

- oriented edge responses at multiple scales within patches
- used 6 oriented edge responses, 5 scales, 4x4 spatial resolution

Shape Context:

- finds edge orientation histograms in a circular neighborhood
- used similar parameters than for Gist

Both yield a high-dimensional feature vector per image

- cluster these vectors via affinity clustering

Icons as the Cluster Center

The best representation is the cluster center

- it can also be thought of as the average visual encoding

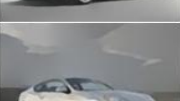

Icons as the Cluster Center

The best representation is the cluster center

- it can also be thought of as the average visual encoding

Example: average car

Convertible	Coupe	Mini van	Pickup truck	Sedan	Sports car	Station wagon	SUV	Van
								
								
								
								
								

Combine textual and image databases to identify visual encodings (VIEs) of abstract concepts

- lexical databases → semantic bridges in the concept domain
- image databases → candidate visuals
- user interface → solicit creative input and break impasses

Combine textual and image databases to identify visual encodings (VIEs) of abstract concepts

- lexical databases → semantic bridges in the concept domain
- image databases → candidate visuals
- user interface → solicit creative input and break impasses

Determine consensus and adapt to target concept

- text and image clustering → test consensus
- illustrative abstraction → remove unwanted detail
- also support semantic abstraction → generalization

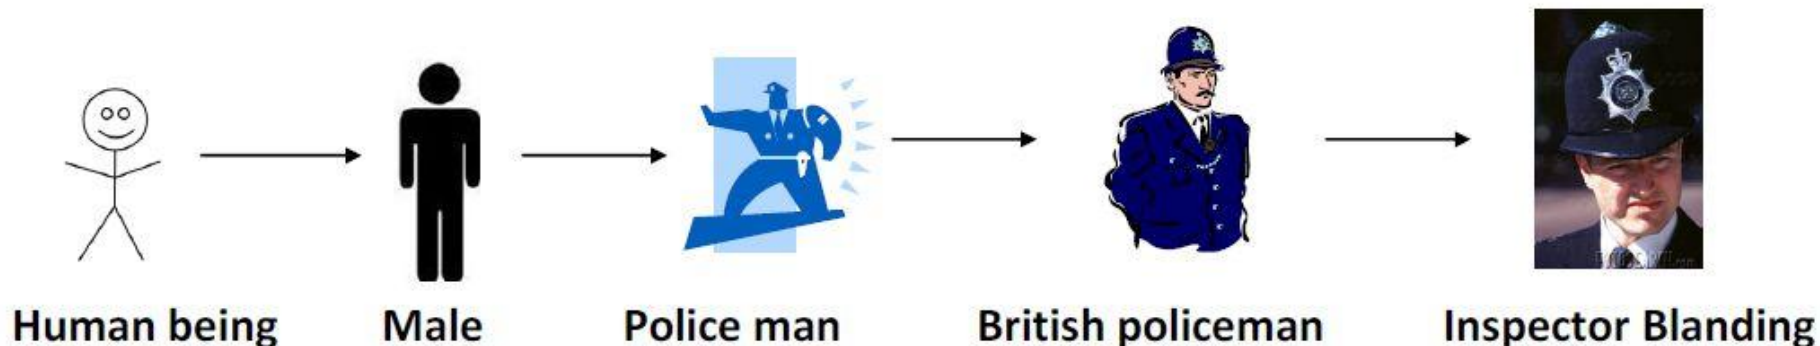

Overall Framework

Combine textual and image databases to identify visual encodings (VIEs) of abstract concepts

- lexical databases → semantic bridges in the concept domain
- image databases → candidate visuals

Visual Abstraction of Semantics

We seek a picture of the given concept that:

- unifies all of the concept's known facts
- abstracts away all unknown (or irrelevant) facts

Visual Abstraction of Semantics

We seek a picture of the given concept that:

- unifies all of the concept's known facts
- abstracts away all unknown (or irrelevant) facts

In images, a 'fact' is expressed as a visual feature

Visual Abstraction of Semantics

We seek a picture of the given concept that:

- unifies all of the concept's known facts
- abstracts away all unknown (or irrelevant) facts

In images, a 'fact' is expressed as a visual feature

A set of images shares features (= facts)

- but also contain a wide selection of other random features (unknown/irrelevant facts).

Visual Abstraction of Semantics

We seek a picture of the given concept that:

- unifies all of the concept's known facts
- abstracts away all unknown (or irrelevant) facts

In images, a 'fact' is expressed as a visual feature

A set of images shares features (= facts)

- but also contain a wide selection of other random features (unknown/irrelevant facts).

Ultimate goal: construct an average image (exemplar) for the given concept

- preserve semantic level of detail (the concept category)
- look for features that are common across a set of queries
- abstract away those features not in common
- do this at a low-level scale

Example: Abstracted Blender

After edge filtering:

- randomly sample edge (feature) points
- align using the Hungarian algorithm
- determine shape-context vector v_s
- measure similarity between two points (Euclidian v_s distance)

Remove poor feature point matches based on:

- low shape-context feature similarity
- large distances in image space (indicating false matches between points in very different parts of the object)

The green points above are those with no good match

Example: Abstracted Blender

Building the average/exemplar from many examples:

- here shown two

Example: Taxonomy of Small Appliances

Coffee Machines

Espresso Machines

Stovetop Espresso

Coffee Grinders

Electric

Coffee, tea, espresso

French Press

Espresso Accessories

Coffee Pods

Accessories

Filters

Tea strainer

Presented an approach for finding good visual information encodings for concepts

Required the integration of many fields

- linguistics
- vision
- computer graphics
- user interfaces (for the human in the loop)

We believe that our framework has great prospects for:

- design of clip art for taxonomies, book illustrations, etc.
- expressive augmentation of graphical node/link diagrams to make these much more engaging and informative

Fully integrate our framework into a graph drawing engine

- use abstractions to summarize certain facts and attributes
- use compositions for compact visual story telling with context and key players
- apply within a visual analytics interface

Expose framework to a wider circle of users, over the web

- will likely result in much more robust icons
- give further insight into personal preferences
- as well as usability and performance

Fully integrate our framework into a graph drawing engine,

- use abstractions to summarize certain facts and attributes
- use compositions for compact visual story telling with context and key players
- apply within a visual analytics interface

Expose framework to a wider circle of users, over the web

- will likely result in much more robust icons
- give further insight into personal preferences
- as well as usability and performance
