PROJECT DESCRIPTION

THE PROJECT GOAL is to use Internet based Classification Tools to build two type classifiers: descriptive and non-descriptive. Discuss the results. Compare these two approaches on the basis of obtained results.

1. Descriptive Classifier

Use a Decision Tree tool to generate sets of discriminant rules describing the content of the data.

Use WEKA:
http://www.cs.waikato.ac.nz/~ml/weka/index.html

2. Non-Descriptive Classifier

Use Neural Networks tool to build your Classifier

Use WEKA or a tool of your choice. Describe specifics of your tool in a way that makes your report comprehensible for others.

Here are some tools suggestions:
http://www.simbrain.net/

PROJECT DATA is provided on the course web page.

This is a real life classification data with TYPE DE ROCHE (Rock Type) as a CLASS attribute. There are 98 records with 48 attributes and 6 classes.

Classes are:

C1 : R. Carbonatees AND R. Carbonatees impures
C2 : Pyrate
C3 : Charcopyrite
C4 : Galene
C5 : Spahlerite
C6 : Sediments terrigenes

Most important attributes (as determined by the expert) are: S, Zn, Pb, Cu, CaO+MgO, CaO, MgO, Fe2O3

This is a real life experimental data and it contains a lot of missing data (no value).

The project has to follow the following steps of DM Process to build the classifiers.

S1: Data Preparation that includes attributes selection, cleaning the data, filling the missing values, etc... to build Project DATA - PD.

S2: Data preprocessing
1. For the Decision Trees **Descriptive Classifier** you use 2 methods of data discretization to the Project Data PD creating two data sets: PD1 and PD2. Describe which methods you used.

2. For the Neural Network **Non-descriptive Classifier** use the Project DATA - PD and your tool method of normalization of your choice. Specify which.

**Building Classifiers**

For each sets of data PD1, PD2 (for Decision Trees), and PD (for Neural Networks) perform the following **Experiments 1-3**.

For each Experiment **compare** the resulting **Descriptive Classifiers** with each other and compare each **Descriptive Classifier** with the resulting **Non-Descriptive Classifier**.

**Experiments 1-3**

**Experiment 1**: use all records to perform the **full classification** (learning), i.e. build a classifier for all classes C1- C6 simultaneously.

**Experiment 2**: use all records to perform the **contrast classification** (contrast learning), i.e. contrasting class C1 with a class notC1 that contains other classes.

**Experiment 3**: repeat Experiments 1, 2 for all records with the **most important attributes** as defined by the expert only.

**Write a detailed Project Description** with methods, motivations, results and submit via Blackboard and e-mail to TA
