# **Convergence of Koebe Iteration Method**

Input: Poly annulus M,  $\partial M = \gamma_0 - \gamma_1 - \cdots - \gamma_n$ ; Output:Conformal map  $\varphi : M \to \mathbb{D}$ , where  $\mathbb{D}$  is a circle domain.

- Compute a slit map, map the surface to the circular slit domain
   *f* : *M* → ℂ, γ<sub>0</sub> and γ<sub>k</sub> are mapped to the exetior and interior circular
   boundary of ℂ;
- I Fill the inner circle using Delaunay refinement mesh generation;
- Sepeat step 1 and 2, fill all the holes step by step;

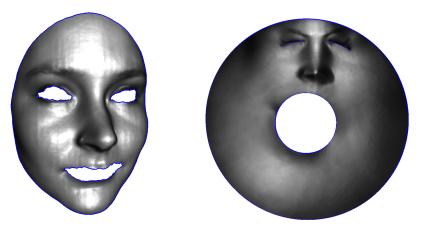

Figure: Slit map.

#### Figure: Final result.

#### Lemma

Suppose A is a topological annulus on  $\mathbb{C}$ , the conformal module of A is  $\mu^{-1} > 1$ , the exterior and interior boundaries of A are Jorgan curves  $\Gamma_0$  and  $\Gamma_1$ ,  $\partial A = \Gamma_0 - \Gamma_1$ , then we have the area and diameter estimates:

$$\alpha(\Gamma_1) \le \mu^2 \alpha(\Gamma_0), \tag{1}$$

and

$$[diam\Gamma_1]^2 \le \frac{\pi}{2\log\mu^{-1}}\alpha(\Gamma_0),\tag{2}$$

where  $\alpha(\Gamma_k)$  is the area bounded by  $\Gamma_k$ , k = 0, 1.

## Area, Diameter Estimate

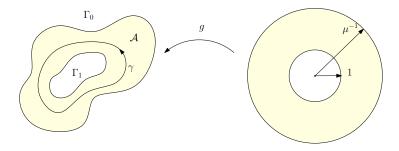

Figure: Topological annulus with conformal module  $\mu^{-1}$ .

# Area, Diameter Estimate

### Proof.

Let holomorphic function g maps  $\{1 \le |w| \le \mu^{-1}\}$  to A,

$$g(w) = w + a_0 + \frac{a_1}{w} + \frac{a_2}{w^2} + \cdots$$

By Gnowell area estimate, we have

$$\alpha(\Gamma_1) = \pi \left( 1 - \sum_{n=1}^{\infty} n |a_n|^2 \right)$$
$$\alpha(\Gamma_0) = \pi \left( \mu^{-2} - \sum_{n=1}^{\infty} n |a_n|^2 \mu^{2n} \right)$$

hence, this proves the area inequality (1)

$$\alpha(\Gamma_0) - \mu^{-2}\alpha(\Gamma_1) = \pi \sum_{n=1}^{\infty} n|a_n|^2(\mu^{-2} - \mu^{2n}) \ge 0$$

David Gu (Stony Brook University)

Computational Conformal Geometry

The diameter diam $\Gamma_1$  is determined by  $g(\{1 < |w| < \rho\})$ , where  $\rho \in (1, \mu^{-1})$ . The diameter is bounded by half of the boundary length  $g(|w| = \rho)$ , we have

$$2\mathsf{diam}\Gamma_1 \leq \int_{|w|=\rho} |g'(w)| dw = \int_0^{2\pi} |g'(\rho e^{i\theta})| \rho \theta = \int_0^2 \pi |g'(\rho e^{i\theta})| \sqrt{\rho} \sqrt{\rho} d\theta$$

By Schwartz inequality, we have

$$[2\mathsf{diam}\Gamma_1]^2 \leq \int_0^{2\pi} |g'(\rho e^{i\theta})|^2 \rho d\theta \int_0^{2\pi} \rho d\theta = 2\pi\rho \int_0^{2\pi} |g'(\rho e^{i\theta})|^2 \rho d\theta$$

# Area, Diameter Estimate

### Continued

Equivalent

$$rac{2}{\pi
ho}[\mathsf{diam} \mathsf{\Gamma}_1]^2 \leq \int_0^{2\pi} |g'(
ho e^{i heta})|^2 
ho d heta$$

Integrate with respect to  $\rho$ ,

$$\int_1^{\mu^{-1}} \frac{2}{\pi\rho} [\mathsf{diam}\Gamma_1]^2 d\rho \leq \int_1^{\mu^{-1}} \int_0^{2\pi} |g'(\rho e^{i\theta})|^2 \rho d\theta d\rho = \alpha(\Gamma_0) - \alpha(\Gamma_1).$$

Calculate left

$$\frac{2\log\mu^{-1}}{\pi}[\mathsf{diam}\Gamma_1]^2 \le \alpha(\Gamma_0) - \alpha(\Gamma_1) \le \alpha(\Gamma_0).$$

This proves inequality (2).

< □ > < /□ >

### Definition (Multi-reflected circle domain)

Given an m-level embedding relation tree of a circle domain C, the union of all nodes in the tree is called a multiple-reflected circle domain,

$$\Omega_m = \bigcup_{k \le m} \bigcup_{(i)=i_1 i_2 \cdots i_k} C^{(i)} = \hat{\mathbb{C}} \setminus \bigcup_{(i)=i_1 i_2 \cdots i_m} \bigcup_{k \ne i_1} \alpha(\Gamma_k^{(i)})$$

where  $\alpha(\Gamma)$  is the area bounded by  $\Gamma$ .

Suppose we have a holomorphic univalent map  $g_m: \Omega_m o \hat{\mathbb{C}}$ , define

$$C_m = g_m(C^0)$$
$$C_m^{(i)} = g_m(C^{(i)})$$
$$\Gamma_{m,k} = g_m(\Gamma_k)$$
$$\Gamma_{m,k}^{(i)} = g_m(\Gamma_k^{(i)})$$

According to the reflection generation tree, we have the symmetry

$$C^{i_1i_2\cdots i_{m-1}i_m} \mid C^{i_1i_2\cdots i_{m-1}i_m} (\Gamma_{i_m})$$

this symmetric relation is preserved by the holomorphic map  $g_m$ :

$$C_{m}^{i_{1}i_{2}\cdots i_{m-1}i_{m}} \mid C_{m}^{i_{1}i_{2}\cdots i_{m-1}i_{m}} (\Gamma_{m,i_{m}})$$

therefore  $g_m$  maps the embedding relation tree of  $\{C^{(i)}\}$  to the embedding relation tree of  $\left\{ C_m^{(i)} \right\}$ .

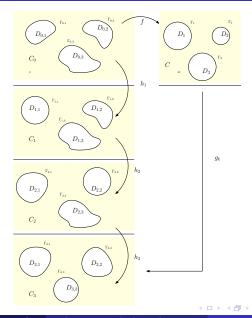

#### Lemma

Suppose the boundaries of  $C_m$  are  $\Gamma_{m,1}, \Gamma_{m,2}, \ldots, \Gamma_{m,n}$ . In the m-level embedding relation tree of  $C_m$ , the total area of the holes bounded by the interior boundaries of leaf nodes is less than  $\mu^{4m}$  times the total area of holes bounded by  $\Gamma_{m,k}$ 's,

$$\sum_{(i)=i_1i_2\cdots i_m}\sum_{k\neq i_1}\alpha(\Gamma_{m,k^{(i)}}) \le \mu^{4m}\sum_{i=1}^n\alpha(\Gamma_{m,i}).$$
(3)

#### Proof.

Using area estimate (1) and induction on m.

David Gu (Stony Brook University)

August 21, 2020

æ

#### Key Observation

Given a multi-annulus  $\mathcal{R}$ , there is a bioholomorphic map  $g : \mathcal{C} \to \mathcal{R}$  maps a circle domain  $\mathcal{C}$  to  $\mathcal{R}$ . During the process of Koebe's iteration, the domain of the mapping  $\mathcal{C}$  can be extended to the image of the multiple reflection, (multiple reflected circle domain), which eventually covers the whole augmented complex plane  $\hat{\mathbb{C}}$ .

#### Lemma

During Koebe's iteration, at the mn-th step, the algorithm generates a univalent holomorphic function  $g_{mn}$ , its domain is extended to the m-level reflected circle domain,

 $g_{mn}:\Omega_m\to \hat{\mathbb{C}}.$ 

#### Proof.

Initial domain is  $C_0, \infty \in C_0$ , the complementary sets are  $D_{0,1}, D_{0,2}, \cdots, D_{0,n}, \partial D_{0,i} = \Gamma_{0,i}, i = 1, 2, \cdots, n.$ There is a biholomorphic function,  $f : C_0 \to C$ , the complementary of C is the set  $D_1, D_2, \cdots, D_n$ , where  $D_i$ 's are disks,  $\partial D_i = \Gamma_i$  is a canonical circle. In the neighborhood of  $\infty$ ,  $f(z) = z + O(z^{-1})$ .

< ロ > < 同 > < 回 > < 回 > < 回 > <

### continued.

By Riemann mapping theorem, there is a Riemann mapping

$$h_1: \hat{\mathbb{C}} \setminus D_{0,1} \to \hat{\mathbb{C}} \setminus \mathbb{D},$$

maps  $\Gamma_{0,1}$  to the unit circle  $\Gamma_{1,1}$ ,  $C_0$  to  $C_1$ , satisfying the normalization condition,

$$h_1(\infty) = \infty, \quad h_1'(\infty) = 1,$$

and

$$D_{1,k} = h_1(D_{0,k}), \ k = 2, \cdots, n.$$

Repeat this procedure, at  $k \leq n$  step, construct a Riemann mapping,

$$h_k: \hat{\mathbb{C}} \setminus D_{k-1,k} \to \hat{\mathbb{C}} \setminus \mathbb{D},$$

which maps  $\Gamma_{k-1,k}$  to the unit circle,  $C_{k-1}$  to  $C_k$ ,  $h_k(\infty) = \infty$  and  $h'(\infty) = 1$ .

#### continued.

We recursively define the symbols as follows:

$$C_{k} = h_{k}(C_{k-1})$$
  

$$\Gamma_{k,i} = h_{k}(\Gamma_{k-1,i}), i \neq k$$
  

$$D_{k,i} = h_{k}(D_{k-1,i}), i \neq k$$

 $D_{k,k}$  is the unit disk  $\mathbb{D}$ ,  $\Gamma_{k,k}$  the unit circle. We construct a biholomorphic map  $f_k : C_0 \to C_k$ :

$$f_k = h_k \circ h_{k-1} \circ \cdots \cdot h_1$$

and the biholomorphic map from the circle domain  $\mathcal C$  to  $\mathcal C_k$ ,  $g_k:\mathcal C o \mathcal C_k$ ,

$$g_k:=f_k\circ f^{-1},$$

 $g_k$  satisfies normalization condition  $g_k(\infty) = \infty$ ,  $g'_k(\infty) = 1$ .

#### continued.

We generalize the domain of  $g_k$  to multiple reflected circle domain. Because  $\Gamma_{1,1}$  is a canonical circle,  $C_1$  can be reflected about  $\Gamma_{1,1}$  to  $C_1^1$ ,

 $C_1 | C_1^1 (\Gamma_{1,1})$ 

 $h_2: \hat{\mathbb{C}} \setminus D_{1,2} o \hat{\mathbb{C}} \setminus \mathbb{D}$ , hence  $h_2$  is well defined on  $D_{1,1}$ . we denote

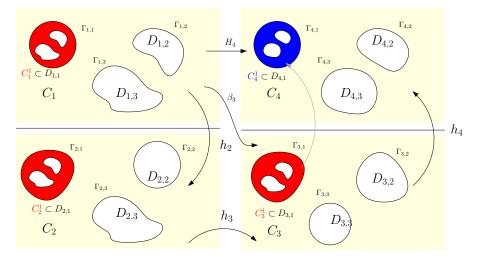

$$C_2^1 := h_2(C_1^1), \quad C_2^1 | C_2 \quad (\Gamma_{2,1}).$$

when  $k = 2, 3, \dots, n$ , the Riemann mapping  $h_k$  is well defined on  $C_k \cup D_{k,1}$ , domain

$$C_k^1 := h_k \circ h_{k-1} \circ \cdots \circ h_1(C_1^1), \ k = 2, \cdots, n,$$

satisfying

$$C_k^1|C_k$$
 ( $\Gamma_{k,1}$ ).

э

→ ∃ →

• • • • • • • • • •

#### continued.

But the map  $h_{n+1}$  on  $D_{n,1}$  is not defined. We can use Schwartz reflection to define  $C_{n+1}^1$ . Consider the composition:

$$\beta_n := h_n \circ h_{n-1} \circ \cdots \circ h_2 : C_1 \to C_n,$$

 $\beta_n$  is well defined on  $D_{1,1}$ .

$$h_{n+1}\circ\beta_n:C_1\to C_{n+1},$$

maps the circle  $\Gamma_{1,1}$  to the circle  $\Gamma_{n+1,1}$ , but is not defined on  $D_{1,1}$ . By Schwartz reflection principle, the map  $h_{n+1} \circ \beta_n$  can be extended to

$$H_{n+1}: C_1 \cup C_1^1 \to C_{n+1} \cup C_{n+1}^1,$$

where

$$C_{n+1}^1|C_n \quad (\Gamma_{n+1,1}).$$

### Continued.

$$\begin{array}{cccc} C_1 \cup C_1^1 & \xrightarrow{\beta_n} & C_n \cup C_n^1 \\ H_{n+1} & & \downarrow H_{n+1 \circ \beta_n^{-1}} \\ C_{n+1} \cup C_{n+1}^1 & \xrightarrow{Id} & C_{n+1} \cup C_{n+1}^1 \end{array}$$

we obtain the composition map

$$H_{n+1} \circ \beta_n^{-1} : C_n \cup \underline{C_n^1} \to C_{n+1} \cup \underline{C_{n+1}^1}.$$

for convenience, we still use  $h_{n+1}$  to represent  $H_{n+1} \circ \beta_n^{-1}$ . Hence, we extend the domain of  $h_{n+1}$  to  $C_n^1$ ,  $h_{n+1} : C_n \cup C_n^1 \to C_{n+1} \cup C_{n+1}^1$ . Repeat this procedure, we conclude: for all  $k \ge 1$ ,  $C_k^1$  and  $C_k$  are symmetric,

$$C_k^1|C_k (\Gamma_{k,1}).$$

< □ > < □ > < □ > < □ > < □ > < □ >

Similarly, when k = 2,  $\Gamma_{2,2}$  is a circle,  $C_2^2$  and  $C_2$  are symmetric about  $\Gamma_{2,2}$ . When k > 2, we define

$$C_k^2 := h_k \circ h_{k-1} \circ \cdots h_3(C_2^2),$$

similarly, for every  $h_{kn+2}$  map, we use Schwartz reflection principle to extend analytically. For all  $k \ge 2$ ,  $C_k^2$  and  $C_k$  are symmetric:

$$C_k^2|C_k \quad (\Gamma_{k,2}).$$

Similarly, for any  $i = 3, \dots, n$ , we use Schwartz reflection principle to extend the domain and define  $C_k^i$  symmetric to  $C_k$ , for all  $k \ge i$ ,

$$C_k^i | C_k \quad (\Gamma_{k,i}).$$

After the first round of iterations, all  $C_k^i$ ,  $i = 1, 2, \dots, n$  are defined. Since  $\Gamma_{n+1,1}$  is the unit circle, we define  $C_{n+1}^{i1}$  to be the mirror image of  $C_{n+1}^i$  with respect to  $\Gamma_{n+1,1}$ ,  $C_{n+1}^{11} = C_{n+1}$ , but all other  $C_{n+1}^{i1}$  are newly generated domains  $i \neq 1$ . Apply the extended Riemann mapping, we get a series of mirror images:

$$C_k^{i1}|C_k^i \quad (\Gamma_{k,1}), \ \forall k \geq n+1, i=2,3,\cdots,n.$$

Similarly, we can define mirror image domains:

$$C_k^{ij}|C_k^i \quad (\Gamma_{k,j}), \quad \forall k \ge n+j.$$

After *mn* iterations, we obtain *m*-level mirror images  $C_k^{i_1i_2\cdots i_m}$ , satisfying the symmetric relation:

$$C_{k}^{i_{1}i_{2}\cdots i_{m}i_{m+1}}|C_{k}^{i_{1}i_{2}\cdots i_{m}}$$
 ( $\Gamma_{k,i_{m+1}}$ ),  $k \geq mn + i_{m+1}$ ,

Now the *j*-th boundary of  $C_k^{i_1i_2\cdots i_mi_{m+1}}$  is denoted as  $\Gamma_{k,j}^{i_1i_2\cdots i_mi_{m+1}}$ ,

$$\partial C_{k}^{i_{1}i_{2}\cdots i_{m}i_{m+1}} = \Gamma_{k,i_{1}}^{i_{1}i_{2}\cdots i_{m}i_{m+1}} - \bigcup_{j\neq i_{1}}^{n} \Gamma_{k,j}^{i_{1}i_{2}\cdots i_{m}i_{m+1}}.$$

Consider 
$$g_k^{-1} = f \circ f_k^{-1}$$
, for all k we have

$$C = g_k^{-1}(C_k)$$

similarly,

$$C^{i_1i_2\cdots i_m} = g_k^{-1}(C_k^{i_1i_2\cdots i_m})$$

and its boundaries

$$\Gamma_{j}^{i_{1}i_{2}\cdots i_{m}} = g_{k}^{-1}(\Gamma_{k,j}^{i_{1}i_{2}\cdots i_{m}}).$$

э

The circle domain  $C = C^0$  is reflected about  $\Gamma_{i_1}, \Gamma_{i_2}, \cdots, \Gamma_{i_k}$  sequentially, to a *k*-level mirror reflection image  $C^{i_1i_2\cdots i_k}$ , its interior boundary is

$$\Gamma_j^{i_1i_2\cdots i_k}=\Gamma_j^{(i)}, \quad j\neq i_1,$$

such that  $i_l$  and  $i_{l+1}$  are not equal. After analytic extension,  $g_k$  is defined on the augmented complex plane with  $n(n-1)^{k-1}$  disks removed. The boundaries of these disks are

$$\bigcup_{i_1i_2\cdots i_k, i_l\neq i_{l+1}}\bigcup_{j\neq i_1}\Gamma_j^{i_1i_2\cdots i_k}$$

We choose a big circle  $\Gamma_{\rho}$ , enclosing all the initial boundaries  $\Gamma_j$ . For any point  $w \in C^0$ , by Cauchy's formula

$$g_k(w) - w = \frac{1}{2\pi i} \oint_{\Gamma_\rho} \frac{g_k(s) - w}{s - w} ds - \sum_{(i),j} \frac{1}{2\pi i} \oint_{\Gamma_j^{(i)}} \frac{g_k(s) - w}{s - w} ds$$

at  $\infty$  neighborhood,  $g_k(w) - w = O(w^{-1})$ , when  $ho o \infty$ 

$$\frac{1}{2\pi i}\oint_{\Gamma_{\rho}}\frac{g_k(s)-w}{s-w}ds=\frac{1}{2\pi i}\oint_{\Gamma_{\rho}}\frac{g_k(s)-s}{s-w}+\frac{s-w}{s-w}ds\to 0.$$

## Error Estimate

Since w is outside all  $\Gamma_j^{(i)}$ , integration

$$\frac{1}{2\pi i}\oint_{\Gamma_j^{(i)}}\frac{w}{s-w}ds=0,$$

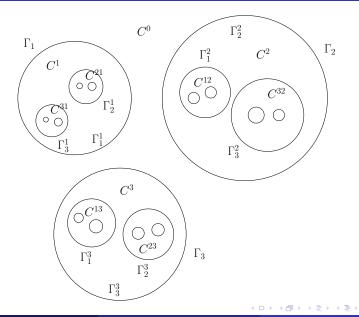

for any complex number  $c_j^{(i)}$ , integration

$$\frac{1}{2\pi i}\oint_{\Gamma_j^{(i)}}\frac{c_j^{(i)}}{s-w}ds=0$$

we obtain

$$g_k(w) - w = -\sum_{(i),j} \frac{1}{2\pi i} \oint_{\Gamma_j^{(i)}} \frac{g_k(s) - c_j^{(i)}}{s - w} ds$$

# Multiple Reflection

David Gu (Stony Brook University)

э

# Error Estimate

In the initial circle domain  $C^0$ , let distance constant

$$\delta := \min_{i \neq j} \operatorname{dist}(\Gamma_i, \Gamma_j^i),$$

we have  $\delta > 0$ . Since  $\Gamma_j^{(i)} \subset \Gamma_{i_{m-1}}^{i_m}$ ,  $|s - w| > \delta$ . Define

$$\delta_{k,j}^{(i)} := \operatorname{diam}\left(\mathsf{\Gamma}_{k,j}^{(i)}\right),\,$$

the curve  $\Gamma_{k,j}^{(i)} = g_k(\Gamma_j^{(i)})$  is enclosed by the circle centered at  $c_j^{(i)}$  and with the diameter  $\delta_{k,j}^{(i)}$ , then for all  $s \in \Gamma_j^{(i)}$ ,

$$|g_k(s) - c_j^{(i)}| \leq \delta_{k,j}^{(i)},$$

the length of the integration is  $\pi \delta_j^{(i)}$ , where  $\delta_j^{(i)} = \text{diam}(\Gamma_j^{(i)})$ .

$$\begin{aligned} |g_{k}(w) - w| &\leq \sum_{(i),j} \frac{1}{2\pi} \oint_{\Gamma_{j}^{(i)}} \frac{|g_{k}(s) - c_{j}^{(i)}|}{|s - w|} |ds| \leq \sum_{(i),j} \frac{1}{2\pi} \frac{\delta_{k,j}^{(i)}}{\delta} \pi \delta_{j}^{(i)} \\ &= \sum_{(i),j} \frac{1}{2\delta} \delta_{k,j}^{(i)} \delta_{j}^{(i)} \leq \sum_{(i),j} \frac{1}{4\delta} \left( [\delta_{k,j}^{(i)}]^{2} + [\delta_{j}^{(i)}]^{2} \right) \end{aligned}$$

For the first term,

$$\sum_{(i),j} [\delta_j^{(i)}]^2 = \frac{4}{\pi} \sum_{(i),j} \alpha(\Gamma_j^{(i)}) \le \mu^{4m} \sum_j \alpha(\Gamma_j) = \frac{4}{\pi} \mu^{4m} \gamma_1,$$

where  $\sum_{j} \alpha(\Gamma_j) = \gamma_1$ .

Image: A matrix

æ

For the second term, consider the topological annus bounded by  $\tilde{\Gamma}_{k,j}^{(i)}$  and  $\Gamma_{k,j}^{(i)}$ , by the diameter estimation (2), we obtain

$$[\delta_{j,k}^{(i)}]^2 \leq \frac{\pi}{2\log\mu^{-1}}\alpha(\widetilde{\Gamma}_{k,j}^{(i)}),$$

By inequality (3), we obtain

$$\sum_{(i),j} [\delta_{j,k}^{(i)}]^2 \le \frac{\pi}{2\log\mu^{-1}} \sum_{(i),j} \alpha(\tilde{\Gamma}_{k,j}^{(i)}) \le \frac{\pi}{2\log\mu^{-1}} \sum_j \alpha(\tilde{\Gamma}_{k,j}) = \frac{\pi}{2\log\mu^{-1}} \mu^{4m} \gamma_2,$$

where  $\gamma_2 = \sum_j \alpha(\tilde{\Gamma}_{k,j})$ .

### Theorem (Koebe Quarter Theorem)

The image of an injective analytic function  $\varphi : \mathbb{D} \to \mathbb{C}$  from the unit disk  $\mathbb{D}$  onto a subset of the complex plane contains the disk whose center is  $\varphi(0)$  and whose radius is  $|\varphi'(0)|/4$ .

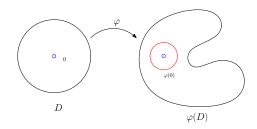

Figure: Koebe's quarter theorem.

45 / 47

## Error Estimate

We estimate  $\gamma_1$  and  $\gamma_2$ . The circle  $\Gamma_{\rho}$  enclose all the circles  $\tilde{\Gamma}_i$ , then  $\gamma_1 < \pi \rho^2$ . Using  $g_k(w)$ , we estimate  $\gamma_2$ .  $g_k$  is univalent on  $|w| > \rho$ , in the neighborhood of  $\infty$ ,  $g_k(w) = w + O(w^{-1})$ . Perform coordinate change  $\zeta = 1/w$ ,  $\eta = 1/z$ , construct univalent holomorphic function  $\varphi : \zeta \to \eta$ ,

$$\varphi(\zeta) = rac{1}{g_k(1/\zeta)},$$

 $\varphi$  is defined on the disk  $|\zeta| < \rho^{-1}$ ,  $\varphi(0) = 0$  and  $\varphi'(0) = 1$ . By Koebe 1/4 theorem,

$$\left\{ |\eta| < \frac{1}{4\rho} \right\} \subset \varphi \left( \left\{ |\zeta| < \frac{1}{\rho} \right\} \right),$$

equivalently

$$\{|z|>4\rho\}\subset g_k(\{|w|>\rho\}),$$

hence all  $\tilde{\Gamma}_{k,j}$  are included in the interior of  $|z| < 4\rho$ , hence the total area of all holes

$$\gamma_2 = \sum_j \alpha(\tilde{\Gamma}_{k,j}) < 16\pi\rho^2.$$

46 / 47

We proved the convergence rate of Koebe's iteration.

Theorem (Convergence Rate of Koebe's Iteration)

In the Koebe's iteration, when k > mn,

$$|g_k(w) - w| \le \frac{1}{4\delta} \left( \frac{4}{\pi} \pi \rho^2 + \frac{\pi}{2 \log \mu^{-1}} 16 \pi \rho^2 \right) \mu^{4m}.$$

This shows  $\mu$  controls the convergence rate.
