# Similarity \& Link Analysis 

Stony Brook University CSE545, Fall 2016

## Finding Similar "Items"

(http://www.datacommunitydc.org/blog/20 13/08/entity-resolution-for-big-data)

## Finding Similar "Items": What we will cover

- Shingling
- Minhashing
- Locality-sensitive hashing
- Distance Metrics

## Document Similarity

Challenge: How to represent the document in a way that can be efficiently encoded and compared?

## Shingles

## Goal: Convert documents to sets

## Shingles

## Goal: Convert documents to sets

步

# k-shingles (aka "character n-grams") <br> - sequence of $k$ characters 

E.g. $k=2$ doc="abcdabd"
singles(doc, 2) $=\{a b, b c, c d, d a, b d\}$

## Shingles

## Goal: Convert documents to sets

## k-shingles (aka "character n-grams") <br> - sequence of $k$ characters

E.g. $k=2$ doc="abcdabd"
singles(doc, 2) $=\{a b, b c, c d, d a, b d\}$

- Similar documents have many common shingles
- Changing words or order has minimal effect.
- In practice use $5<\mathrm{k}<10$

## Shingles

## Goal: Convert documents to sets

Large enough that any given shingle appearing a document is highly unlikely (e.g. < .1\% chance)

Can hash large shingles to smaller (e.g. 9-shingles into 4 bytes)

Can also use words (aka n-grams).

- In practice use $5<k<10$

## Shingles

Problem: Even if hashing, sets of shingles are large (e.g. 4 bytes $=>4 x$ the size of the document).

## Minhashing

## Goal: Convert sets to shorter ids, signatures

## Minhashing - Background

## Goal: Convert sets to shorter ids, signatures

Characteristic Matrix, $X$ :

| Element | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :---: | :--- | :--- | :--- | :--- |
| $a$ | 1 | 0 | 0 | 1 |
| $b$ | 0 | 0 | 1 | 0 |
| $c$ | 0 | 1 | 0 | 1 |
| $d$ | 1 | 0 | 1 | 1 |
| $e$ | 0 | 0 | 1 | 0 |

(Leskovec at al., 2014; http://www.mmds.org/)
often very sparse! (lots of zeros)

Jaccard Similarity:

$$
\operatorname{sim}\left(S_{1}, S_{2}\right)=\frac{S_{1} \cap S_{2}}{S_{1} \cup S_{2}}
$$

## Minhashing - Background

Characteristic Matrix:

|  | $S_{1}$ | $S_{2}$ |
| :--- | :--- | :--- |
| ab | 1 | 1 |
| bc | 0 | 1 |
| de | 1 | 0 |
| ah | 1 | 1 |
| ha | 0 | 0 |
| ed | 1 | 1 |
| ca | 0 | 1 |

## Jaccard Similarity:

$$
\operatorname{sim}\left(S_{1}, S_{2}\right)=\frac{S_{1} \cap S_{2}}{S_{1} \cup S_{2}}
$$

## Minhashing - Background

Characteristic Matrix:

|  | $S_{1}$ | $S_{2}$ |  |
| :--- | :--- | :--- | :--- |
| ab | 1 | 1 | $* *$ |
| bc | 0 | 1 | $*$ |
| de | 1 | 0 | $*$ |
| ah | 1 | 1 | $* *$ |
| ha | 0 | 0 |  |
| ed | 1 | 1 | $* *$ |
| ca | 0 | 1 | $*$ |

## Jaccard Similarity:

$$
\operatorname{sim}\left(S_{1}, S_{2}\right)=\frac{S_{1} \cap S_{2}}{S_{1} \cup S_{2}}
$$

## Minhashing - Background

Characteristic Matrix:

|  | $S_{1}$ | $S_{2}$ |  |
| :--- | :--- | :--- | :--- |
| ab | 1 | 1 | $* *$ |
| bc | 0 | 1 | $*$ |
| de | 1 | 0 | $*$ |
| ah | 1 | 1 | $* *$ |
| ha | 0 | 0 |  |
| ed | 1 | 1 | $* *$ |
| ca | 0 | 1 | $*$ |

## Jaccard Similarity:

$$
\operatorname{sim}\left(S_{1}, S_{2}\right)=\frac{S_{1} \cap S_{2}}{S_{1} \cup S_{2}}
$$

$\operatorname{sim}\left(S_{1} S_{2}\right)=3 / 6$
\# both have / \# at least one has

## Shingles

Problem: Even if hashing, sets of shingles are large (e.g. 4 bytes => $4 x$ the size of the document).

## Approximate Approach:

## Minhashing

Characteristic Matrix: $X$

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| ab | 1 | 0 | 1 | 0 |
| bc | 1 | 0 | 0 | 1 |
| de | 0 | 1 | 0 | 1 |
| ah | 0 | 1 | 0 | 1 |
| ha | 0 | 1 | 0 | 1 |
| ed | 1 | 0 | 1 | 0 |
| ca | 1 | 0 | 1 | 0 |

1) Instead of keeping whole characteristic matrix, just keep first row where 1 is encountered.
2) Shuffle and repeat to get a "signature" for each set.

## Minhashing

Characteristic Matrix:

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| ab | 1 | 0 | 1 | 0 |
| bc | 1 | 0 | 0 | 1 |
| de | 0 | 1 | 0 | 1 |
| ah | 0 | 1 | 0 | 1 |
| ha | 0 | 1 | 0 | 1 |
| ed | 1 | 0 | 1 | 0 |
| ca | 1 | 0 | 1 | 0 |

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to first row where set appears.

## Minhashing

Characteristic Matrix:

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| ab | 1 | 0 | 1 | 0 |
| bc | 1 | 0 | 0 | 1 |
| de | 0 | 1 | 0 | 1 |
| ah | 0 | 1 | 0 | 1 |
| ha | 0 | 1 | 0 | 1 |
| ed | 1 | 0 | 1 | 0 |
| ca | 1 | 0 | 1 | 0 |

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to first row where set appears.

| permuted <br> order |
| :--- |
| 1 ha |
| 2 ed |
| 3 ab |
| 4 bc |
| 5 ca |
| 6 ah |
| 7 de |

## Minhashing

Characteristic Matrix:

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | ab | 1 | 0 | 1 | 0 |
| 4 | bc | 1 | 0 | 0 | 1 |
| 7 | de | 0 | 1 | 0 | 1 |
| 6 | ah | 0 | 1 | 0 | 1 |
| 1 | ha | 0 | 1 | 0 | 1 |
| 2 | ed | 1 | 0 | 1 | 0 |
| 5 | ca | 1 | 0 | 1 | 0 |

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to first row where set appears.

| permuted <br> order |
| :--- |
| 1 ha |
| 2 ed |
| 3 ab |
| 4 bc |
| 5 ca |
| 6 ah |
| 7 de |

## Minhashing

Characteristic Matrix:

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | permuted order |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | ab | 1 | 0 | 1 | 0 | 1 ha |
| 4 | bc | 1 | 0 | 0 | 1 | 2 ed |
| 7 | de | 0 | 1 | 0 | 1 | 3 ab |
| 6 | ah | 0 | 1 | 0 | 1 | 4 bc |
| 1 | ha | 0 | 1 | 0 | 1 | 5 ca |
| 2 | ed | 1 | 0 | 1 | 0 | 6 ah |
| 5 | ca | 1 | 0 | 1 | 0 | 7 de |

(Leskovec at al., 2014; http://www.mmds.org/)
$h\left(\mathrm{~S}_{1}\right)=$ ed \#permuted row 2 $h\left(S_{2}\right)$ = ha \#permuted row 1

$$
h\left(\mathrm{~S}_{3}\right)=
$$

## Minhashing

Characteristic Matrix:

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | permuted order |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | ab | 1 | 0 | 1 | 0 | 1 ha |
| 4 | bc | 1 | 0 | 0 | 1 | 2 ed |
| 7 | de | 0 | 1 | 0 | 1 | 3 ab |
| 6 | ah | 0 | 1 | 0 | 1 | 4 bc |
| 1 | ha | 0 | 1 | 0 | 1 | 5 ca |
| 2 | ed | 1 | 0 | 1 | 0 | 6 ah |
| 5 | ca | 1 | 0 | 1 | 0 | 7 de |

(Leskovec at al., 2014; http://www.mmds.org/)

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to first row where set appears.
$h\left(\mathrm{~S}_{1}\right)=$ ed \#permuted row 2 $h\left(\mathrm{~S}_{2}\right)=$ ha \#permuted row 1
$h\left(S_{3}\right)=$ ed \#permuted row 2
$h\left(\mathrm{~S}_{4}\right)=$

## Minhashing

Characteristic Matrix:

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | permuted order |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | ab | 1 | 0 | 1 | 0 | 1 ha |
| 4 | bc | 1 | 0 | 0 | 1 | 2 ed |
| 7 | de | 0 | 1 | 0 | 1 | 3 ab |
| 6 | ah | 0 | 1 | 0 | 1 | 4 bc |
| 1 | ha | 0 | 1 | 0 | 1 | 5 ca |
| 2 | ed | 1 | 0 | 1 | 0 | 6 ah |
| 5 | ca | 1 | 0 | 1 | 0 | 7 de |

(Leskovec at al., 2014; http://www.mmds.org/)

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to first row where set appears.
$h\left(S_{1}\right)=$ ed \#permuted row 2 $h\left(S_{2}\right)$ = ha \#permuted row 1
$h\left(S_{3}\right)$ = ed \#permuted row 2
$h\left(\mathrm{~S}_{4}\right)=$ ha \#permuted row 1

## Minhashing

Characteristic Matrix:

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | ab | 1 | 0 | 1 | 0 |
| 4 | bc | 1 | 0 | 0 | 1 |
| 7 | de | 0 | 1 | 0 | 1 |
| 6 | ah | 0 | 1 | 0 | 1 |

| 5 | 7 | 2 | ed | 1 | 0 | 1 | 0 |  |  |  |  |  |  |
| 4 | 5 | 5 | ca | 1 | 0 | 1 | 0 |  |  |  |  |  |  |

Minhash function: $h$

- Based on permutation of rows in the characteristic matrix, $h$ maps sets to rows.

## Signature matrix: $M$

- Record first row where each set had a 1 in the given permutation

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| $h_{1}$ | 2 | 1 | 2 | 1 |
| $h_{2}$ | 2 | 1 | 4 | 1 |
| $h_{3}$ | 1 | 2 | 1 | 2 |
| $\ldots$ |  |  |  |  |
| $\ldots$ |  |  |  |  |

## Minhashing

Characteristic Matrix:

|  |  |  |  |  |  |  |  |  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 4 | 3 | ab | 1 | 0 | 1 | 0 |  |  |  |  |  |  |
| 3 | 2 | 4 | bc | 1 | 0 | 0 | 1 |  |  |  |  |  |  |
| 7 | 1 | 7 | de | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 6 | 3 | 6 | ah | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 2 | 6 | 1 | ha | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 5 | 7 | 2 | ed | 1 | 0 | 1 | 0 |  |  |  |  |  |  |
| 4 | 5 | 5 | ca | 1 | 0 | 1 | 0 |  |  |  |  |  |  |

## Property of signature matrix:

The probability for any $h_{i}$ (i.e. any row), that $h_{i}\left(S_{1}\right)=h_{i}\left(S_{2}\right)$ is the same as $\operatorname{Sim}\left(S_{1}, S_{2}\right)$

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| $h_{1}$ | 2 | 1 | 2 | 1 |
| $h_{2}$ | 2 | 1 | 4 | 1 |
| $h_{3}$ | 1 | 2 | 1 | 2 |
| $\ldots$ |  |  |  |  |
| $\cdots$ |  |  |  |  |

## Minhashing

Characteristic Matrix:

|  |  |  |  |  |  |  |  |  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 4 | 3 | ab | 1 | 0 | 1 | 0 |  |  |  |  |  |  |
| 3 | 2 | 4 | bc | 1 | 0 | 0 | 1 |  |  |  |  |  |  |
| 7 | 1 | 7 | de | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 6 | 3 | 6 | ah | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 2 | 6 | 1 | ha | 0 | 1 | 0 | 1 |  |  |  |  |  |  |
| 5 | 7 | 2 | ed | 1 | 0 | 1 | 0 |  |  |  |  |  |  |
| 4 | 5 | 5 | ca | 1 | 0 | 1 | 0 |  |  |  |  |  |  |

## Property of signature matrix:

The probability for any $h_{i}$ (i.e. any row), that $h_{i}\left(S_{1}\right)=h_{i}\left(S_{2}\right)$ is the same as $\operatorname{Sim}\left(S_{1}, S_{2}\right)$

Thus, similarity of signatures $S_{1}, S_{2}$ is the fraction of minhash functions (i.e. rows) in which they agree.

## Property of signature matrix:

The probability for any $h_{i}$ (i.e. any row), that $h_{i}\left(S_{1}\right)=h_{i}\left(S_{2}\right)$ is the same as $\operatorname{Sim}\left(S_{1}, S_{2}\right)$

Thus, similarity of signatures $S_{1}, S_{2}$ is the fraction of minhash functions (i.e. rows) in which they agree.

Estimated $\operatorname{Sim}\left(\mathrm{S}_{1}, \mathrm{~S}_{3}\right)=$ agree $/$ all $=2 / 3$

Real $\operatorname{Sim}\left(\mathrm{S}_{1}, \mathrm{~S}_{3}\right)=$ Type a / $(a+b+c)=3 / 4$

Try $\operatorname{Sim}\left(\mathrm{S}_{2}, \mathrm{~S}_{4}\right)$ and $\operatorname{Sim}\left(S_{1}, S_{2}\right)$

## Minhashing

In Practice
Problem:

- Can't reasonably do permutations (huge space)
- Can't randomly grab rows according to an order (random disk seeks = slow!)

## Minhashing

In Practice

## Problem:

- Can't reasonably do permutations (huge space)
- Can't randomly grab rows according to an order (random disk seeks = slow!)
Solution: Use "random" hash functions.
- Setup:
- Pick ~100 hash functions, hashes
- Store M[i][s] = a potential minimum $h_{i}(r)$
\#initialized to infinity (num hashs x num sets)

## Minhashing

Solution: Use "random" hash functions.

- Setup:
- Pick ~100 hash functions, hashes
- Store M[i][s] = a potential minimum $h_{i}(r)$
\#initialized to infinity (num hashs x num sets)
- Algorithm:

compute $h_{i}(r)$ for all $i$ in hashes \#precompute 100 values
for each set $s$ in row $r$ :
if $\mathrm{cm}[\mathrm{r}][\mathrm{s}]==1$ :
for $i$ in hashes: \#check which hash produces smallest value if $h_{i}(r)<M[i][s]: M[i][s]=h_{i}(r)$

## Minhashing

Solution: Use "random" hash functions.

- Setup:
- Pick ~100 hash functions, hashes
- Store M[i][s] = a potential minimum $h_{i}(r)$
\#initialized to i
- Algorithm:

## Known as "efficient minhashing".

for $r$ in rows of $\mathrm{cm}: \# c m$ is characteristic matrix
compute $h_{i}(r)$ for all i in hashes \#precompute 100 values
for each set $s$ in row $r$ :
if cm[r][s] == 1:
for i in hashes: \#check which hash produces smallest value if $h_{i}(r)<M[i][s]: M[i][s]=h_{i}(r)$

## Minhashing

## What hash functions to use?

## Start with 2 decent hash functions

e.g. $h_{a}(x)=$ ascii $($ string $)$ \% large_prime_number
$h_{b}(x)=\left(3^{*}\right.$ ascii $($ string $\left.)+16\right) \%$ large_prime_number
https://www.eecs.harvard.edu/~michaelm/postscripts/rsa2008.pdf

## Minhashing

## What hash functions to use?

## Start with 2 decent hash functions

e.g. $h_{a}(x)=$ ascii $($ string $)$ \% large_prime_number
$h_{b}(x)=\left(3^{*}\right.$ ascii $($ string $\left.)+16\right) \%$ large_prime_number
Add together multiplying the second times i:

$$
\begin{aligned}
& h_{i}(x)=h_{a}(x)+i^{*} h_{b}(x) \\
& \text { e.g. } h_{5}(x)=h_{a}(x)+5 * h_{b}(x)
\end{aligned}
$$

https://www.eecs.harvard.edu/~michaelm/postscripts/rsa2008.pdf

## Minhashing

Problem: Even if hashing, sets of shingles are large (e.g. 4 bytes $=>4 x$ the size of the document).

## Minhashing

Problem: Even if hashing, sets of shingles are large (e.g. 4 bytes => $4 x$ the size of the document).

New Problem: Even if the size of signatures are small, it can be computationally expensive to find similar pairs.
E.g. 1 m documents; $1,000,000$ choose $2=500,000,000,000$ pairs

## Locality-Sensitive Hashing

## Goal: find pairs of minhashes likely to be similar (in order to then test more precisely for similarity).

Candidate pairs: pairs of elements to be evaluated for similarity.

## Locality-Sensitive Hashing

Goal: find pairs of minhashes likely to be similar (in order to then test more precisely for similarity).

Candidate pairs: pairs of elements to be evaluated for similarity.

If we wanted the similarity for all pairs of documents, could anything be done?

## Locality-Sensitive Hashing

## Goal: find pairs of minhashes likely to be similar (in order to then test more precisely for similarity).

Candidate pairs: pairs of elements to be evaluated for similarity.
Approach: Hash multiple times over subsets of data: similar items are likely in the same bucket once.

## Locality-Sensitive Hashing

## Goal: find pairs of minhashes likely to be similar (in order to then test more precisely for similarity).

Candidate pairs: pairs of elements to be evaluated for similarity.
Approach: Hash multiple times over subsets of data: similar items are likely in the same bucket once.

Approach from MinHash: Hash columns of signature matrix
$\Longrightarrow$ Candidate pairs end up in the same bucket.

## Locality-Sensitive Hashing

Signature matrix $M$

Step 1: Add bands<br>Step 2: Hash columns within bands

## Locality-Sensitive Hashing

## Locality-Sensitive Hashing

## Locality-Sensitive Hashing

## Step 1: Add bands

## Locality-Sensitive Hashing

## Step 2: Hash columns

 within bands
## Document Similarity Pipeline

## Realistic Example: Probabilities of agreement

- 100,000 documents
- 100 random permutations/hash functions/rows
=> if 4byte integers then 40 Mb to hold signature matrix
$=>$ still 100 k choose 2 is a lot ( $\sim$ billion)

## Realistic Example: Probabilities of agreement

- 100,000 documents
- 100 random permutations/hash functions/rows
=> if 4byte integers then 40 Mb to hold signature matrix
=> still 100k choose 2 is a lot ( $\sim$ billion)
- 20 bands of 5 rows
- Want $80 \%$ Jaccard Similarity ; for any row $p\left(S_{1}==S_{2}\right)=.8$

## Realistic Example: Probabilities of agreement

- 100,000 documents
- 100 random permutations/hash functions/rows
=> if 4byte integers then 40 Mb to hold signature matrix
=> still 100k choose 2 is a lot ( $\sim$ billion)
- 20 bands of 5 rows
- Want $80 \%$ Jaccard Similarity ; for any row $p\left(S_{1}==S_{2}\right)=.8$
$P\left(S_{1}==S_{2} \mid b\right)$ : probability $S 1$ and $S 2$ agree within a given band

## Realistic Example: Probabilities of agreement

- 100,000 documents
- 100 random permutations/hash functions/rows
=> if 4byte integers then 40 Mb to hold signature matrix
=> still 100k choose 2 is a lot ( $\sim$ billion)
- 20 bands of 5 rows
- Want 80\% Jaccard Similarity ; for any row $p\left(S_{1}==S_{2}\right)=.8$
$P\left(S_{1}==S_{2} \mid b\right)$ : probability S1 and S2 agree within a given band

$$
=0.8^{5}=.328 \quad \Rightarrow \quad P\left(S_{1}!=S_{2} \mid b\right)=1-.328=.672
$$

$P\left(S_{1}!=S_{2}\right)$ : probability S 1 and S 2 do not agree in any band

## Realistic Example: Probabilities of agreement

- 100,000 documents
- 100 random permutations/hash functions/rows
=> if 4byte integers then 40 Mb to hold signature matrix
=> still 100k choose 2 is a lot ( $\sim$ billion)
- 20 bands of 5 rows

$P\left(S_{1}==S_{2} \mid b\right)$ : probability $S 1$ and $S 2$ agree within a given band

$$
=0.8^{5}=.328 \Rightarrow P\left(S_{1}!=S_{2} \mid b\right)=1-.328=.672
$$

$\mathrm{P}\left(\mathrm{S}_{1}!=\mathrm{S}_{2}\right)$ : probability S 1 and S 2 do not agree in any band

$$
=.672^{20}=.00035
$$

What if wanting $40 \%$ Jaccard Similarity?

## Distance Metrics

Pipeline gives us a way to find near-neighbors in high-dimensional space based on Jaccard Distance (1 - Jaccard Sim).

## Distance Metrics

Pipeline gives us a way to find near-neighbors in high-dimensional space based on Jaccard Distance (1-Jaccard Sim).

## Typical properties of a

 distance metric, $d$ :$$
\begin{aligned}
& d(x, x)=0 \\
& d(x, y)=d(y, x) \\
& d(x, y) \leq d(x, z)+d(z, y)
\end{aligned}
$$

## Distance Metrics

Pipeline gives us a way to find near-neighbors in high-dimensional space based on Jaccard Distance (1-Jaccard Sim).

There are other metrics of similarity. e.g:

- Euclidean Distance
- Cosine Distance
- Edit Distance
- Hamming Distance

## Distance Metrics

Pipeline gives us a way to find near-neighbors in high-dimensional space based on Jaccard Distance (1-Jaccard Sim).

There are other metrics of similarity. e.g:

- Euclidean Distance

$$
\begin{aligned}
& \text { arity. e.g: } \\
& \text { distance }(X, Y)=\sqrt{\sum_{i}^{n}\left(x_{i}-y_{i}\right)^{2}}
\end{aligned}
$$

("L2 Norm")

- Cosine Distance
- Edit Distance
- Hamming Distance

## Distance Metrics

& \text { arity. e.g: } \\
& \text { distance }(X, Y)=\sqrt{\sum_{i}^{n}\left(x_{i}-y_{i}\right)^{2}} \quad \text { ("L2 Norm") }
\end{aligned}
$$

- Cosine Distance
- Edit Distance
- Hamming Distance

## Locality Sensitive Hashing - Theory

LSH Can be generalized to many distance metrics by converting output to a probability and providing a lower bound on probability of being similar.

## Locality Sensitive Hashing - Theory

LSH Can be generalized to many distance metrics by converting output to a probability and providing a lower bound on probability of being similar.
E.g. for euclidean distance:

- Choose random lines (analogous to hash functions in minhashing)
- Project the two points onto each line; match if two points within an interval

Transition Matrix, M

Innovation: What pages would a "random Web surfer" end up at?
To start: $N=4$ nodes, so $r=[1 / 4,1 / 4,1 / 4,1 / 4$, after 1st iteration: $M \cdot r=[3 / 8,5 / 24,5 / 24,5 / 24]$ after 2nd iteration: $M(M \cdot r)=M^{2} \cdot r=[15 / 48,11 / 48, \ldots]$

## Power iteration algorithm

initialize: $r[0]=[1 / N, \ldots, 1 / N]$,

$$
r[-1]=[0, \ldots, 0]
$$

while (err_norm(r[t],r[t-1])>min_err):
err_norm(v1, v2) = |v1 - v2| \#L1 norm

| to $\backslash$ from | $\boldsymbol{A}$ | $\boldsymbol{B}$ | $\boldsymbol{C}$ | $\boldsymbol{D}$ |
| :---: | :--- | :--- | :--- | :--- |
| $\boldsymbol{A}$ | 0 | $1 / 2$ | 1 | 0 |

| $\boldsymbol{D}$ | $1 / 3$ | $1 / 2$ | 0 | 0 |

"Transition Matrix", $M$

As err_norm gets smaller we are moving toward: $r=M \cdot r$

## View 3: Eigenvectors:

## Power iteration algorithm

$$
\begin{aligned}
& \text { initialize: } \quad r[0]=[1 / N, \ldots, 1 / N], \\
& r[-1]=[0, \ldots, 0] \\
& \text { while (err_norm }(r[t], r[t-1])>\text { min_err }): \\
& \quad r[t+1]=M \cdot r[t] \\
& \quad t+=1
\end{aligned}
$$

As err_norm gets smaller we are moving toward: $r=M \cdot r$

## View 3: Eigenvectors:

We are actually just finding the eigenvector of $M$.

## Power iteration algorithm

$$
\begin{array}{ll}
\text { initialize: } & r[0]=[1 / N, \ldots, 1 / N] \quad \text { eigenvector of } \lambda \text { if: } \\
& r[-1]=[0, \ldots, 0]
\end{array}
$$

$x$ is an

$$
A \cdot x=\lambda \cdot x
$$

while (err_norm(r[t],r[t-1])>min_err):

$$
\begin{aligned}
& r[t+1]=M \cdot r[t] \\
& t+=1
\end{aligned}
$$

solution $=r[t]$
err_norm(v1, v2) = |v1 - v2| \#L1 norm

As err_norm gets smaller we are moving toward: $r=M \cdot r$

## View 3: Eigenvectors:

We are actually just finding the eigenvector of $M$.

## Power iteration algorithm

$$
\begin{array}{ll}
\text { initialize: } & r[0]=[1 / N, \ldots, 1 / N] \quad \text { eigenvector of } \lambda \text { if: } \\
& r[-1]=[0, \ldots, 0]
\end{array}
$$

$x$ is an

$$
A \cdot x=\lambda \cdot x
$$

while (err_norm(r[t],r[t-1])>min_err):

$$
\begin{aligned}
& r[t+1]=M \cdot r[t] \\
& t+=1
\end{aligned}
$$

solution $=r[t]$

$$
A=1
$$

since columns of M sum to 1 .
thus, $1 r=M r$
err_norm(v1, v2) = |v1 - v2| \#L1 norm

## View 4: Markov Process

Where is surfer at time $\mathrm{t}+1 ? \quad \mathrm{p}(\mathrm{t}+1)=\mathrm{M} \cdot \mathrm{p}(\mathrm{t})$
Suppose: $p(t+1)=p(t)$, then $p(t)$ is a stationary distribution of a random walk.
Thus, $r$ is a stationary distribution. Probability of being at given node.

## View 4: Markov Process

Where is surfer at time $t+1 ? \quad p(t+1)=M \cdot p(t)$
Suppose: $p(t+1)=p(t)$, then $p(t)$ is a stationary distribution of a random walk.
Thus, $r$ is a statipnary distribution. Probability of being at given node.
aka 1st order Markov Process

- Rich probabilistic theory. One finding:
- Stationary distributions have a unique distribution if:
- No "dead-ends": a node can't propagate its rank
- No "spider traps": set of nodes with no way out.

Also known as being stochastic, irreducible, and aperiodic.
