Gartner Says 8.4 Billion Connected "Things" Will Be in Use in 2017, Up 31 Percent From 2016

Consumer Applications to Represent 63 Percent of Total IoT Applications in 2017

Gartner, Inc. forecasts that **8.4 billion connected things will be in use worldwide in 2017, up 31 percent from 2016, and will reach 20.4 billion by 2020.** Total spending on endpoints and services will reach almost \$2 trillion in 2017.

Regionally, Greater China, North America and Western Europe are driving the use of connected things and the three regions together will represent 67 percent of the overall [Internet of Things](#) (IoT) installed base in 2017.

Consumer Applications to Represent 63 Percent of Total IoT Applications in 2017

The consumer segment is the largest user of connected things with 5.2 billion units in 2017, which represents 63 percent of the overall number of applications in use (see Table 1). [Businesses are on pace to employ 3.1 billion connected things in 2017.](#) "Aside from automotive systems, the applications that will be most in use by consumers will be smart TVs and digital set-top boxes, while smart electric meters and commercial security cameras will be most in use

It's no surprise that the Internet of Things (IoT) devices are highly vulnerable to cyber attacks but who would know a time would come when these devices will become a security threat to institutions?

A few months ago researchers exposed life threatening vulnerabilities in IIoT (Industrial Internet of Things) devices specifically Industrial robots. In their findings, robots could be hacked, but in this case, we are about to discuss a smart coffee machine or an Internet connected coffee machine.

More: [San Francisco Railway' Fare System Hacked for 100 Bitcoin Ransom](#)

The incident took place in June 2017 and was shared by a chemical engineer on Reddit who goes by the handle of "C10H15N1." He works as a PLC (Programmable Logic Controllers) expert in a company that has multiple petrochemical factories making chemicals in Europe.

Facebook knows you're gay before you do

3/20/13 4:29pm by Jon Green 39 Comments

Like 2k Tweet 761 3 points 8+1 39

Am I the only one creeped out that Facebook is now guessing, sometimes correctly, if its users are gay?

In the world of Big Data, our private lives are increasingly becoming intermingled with the shadowy, yet public, world of cyberspace.

Whenever we go online we are providing data that can be used to market to us; from Google searches to Facebook likes to eBay purchases, we are inputting data into a series of mathematical models which make *incredibly* educated guesses about the kinds of people we are.

Facebook creepily offers help to a gay guy thinking of "coming out"

Enter Matt. As [BuzzFeed](#) notes, Matt was your typical Facebook user who suddenly found an ad in his news feed for help in coming out. The weird thing was that Matt "did" need help coming out, and understandably he was more than a bit curious as to how Facebook knew.

At first, Matt wondered if Facebook had accessed his text messages, as he had confided in a close friend the previous

How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did

[+ Comment Now](#) [+ Follow Comments](#)

Every time you go shopping, you share intimate details about your consumption patterns with retailers. And many of those retailers are studying those details to figure out what you like, what you need, and which coupons are most likely to make you happy. [Target](#), for example, has figured out how to data-mine its way into your womb, to figure out whether you have a baby on the way long before you need to start buying diapers.

Target has got you in its aim

Charles Duhigg outlines in the [New York Times](#) how Target tries to hook parents-to-be at that crucial moment before they turn into rampant — and

Web Browsing Tracking

Webpages are often mashups of content loaded from different sources

- Ads, images, videos, widgets, ...

- IMG URLs, IFRAMEs, JavaScript, web fonts, Flash/applets, ...

- Hosted on third-party servers: CDNs, cloud providers, ad networks, ...

A third party involved in many different websites can track user visits across all those websites

- 2+ third parties may collude to expand their collective “view”

Need to learn two key pieces of information

- What webpage was visited***

- Who visited it***

Microsoft Announces Turning Windows 10 Phones Into Desktops

Posted 2 hours ago by Kyle F

1,769 SHARES [comment icon] [Facebook icon] [Twitter icon] [LinkedIn icon]

DISCONNECT

Show list view

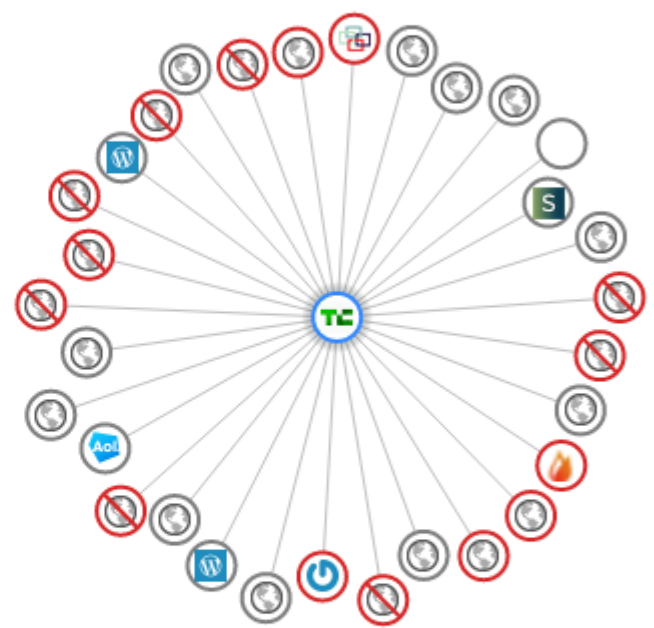

Browse the web normally. As you do, the graph in this popup and the counter in the toolbar will update. Each circle in the graph represents a site that's been or would've been sent some of your personal info.

Circles with a halo are sites you've visited. Circles without a halo are sites you haven't.

Red circles are known tracking sites. Gray circles aren't but may still track you.

Mouse over a circle to view that site's tracking footprint. Click a red circle to block or unblock that site.

Unblock tracking sites
Hide sidebar

What webpage was visited?

HTTP Referer [sic] header

The URL of the webpage from which a link was followed

Useful for statistics/analytics, bad for privacy

Can be turned off through browser options/extensions

HTML5 `rel="noreferrer"` anchor attribute to indicate to the user agent not to send a referrer when following the link

Page-specific, session-specific, user-specific URLs

Unique URL per page (even for the same resource) → track what page was visited

Unique URL per session/user → distinguish between visits from different users

Tracking URLs are also commonly used in promotional emails

Embedded image loading

This is an active email address!

Detect the time a user viewed a message

The request reveals much more: user agent, device, location, ...

Embedded links

Learn which email addresses resulted in visits (click-through rate)

Default behavior of email clients varies

Gmail used to block images by default, now uses image proxy servers

Tracking through unique images still possible: senders can track the first time a message is opened (user's IP is not exposed though)

Who visited the page?

Browsing to a web page reveals a wealth of information

Source IP address

Not very accurate (e.g., NAT, DHCP, on-the-go users) but still useful

Third-party cookies: precise user tracking

Easy to block (configurable in most browsers, defaults vary)

“Evercookies:” exploit alternative browser state mechanisms

Flash/Silverlight/other plugin-specific storage, ETags, HTML5 session/local/global storage, caches, ...

Browser/device fingerprinting: recognize unique system characteristics

Browser user agent, capabilities, plugins, system fonts, screen resolution, time zone, and numerous other properties

What do web tracking techniques really track?

Distinguish between different visitors

Track anonymous individuals

Actually: track the pages visited by a particular browser running on a particular device

Better: distinguish between different *persons*

Track named individuals

The transition is easy...

Personally identifiable information (PII) is often voluntarily provided to websites:

Social networks, cloud services, web sites requiring user registration, ...

Cookies/sessions are associated with PII

Contamination: trackers may collude with services

Previously “anonymous” cookies/fingerprints can be associated with named individuals

All existing solutions disable content personalization

Privacy vs. functionality dilemma

- (a)  Like  43 likes. Sign Up to see what your friends like.
- (b)  Like  43 people like this.
- (c)  Like  Jane Doe, John Doe and 41 others like this.

First Party Isolation (Firefox)

AKA Cross-Origin Identifier Unlinkability (Tor Browser)

All identifier sources and browser state are scoped (isolated) using the URL bar domain

Cookies, cache, HTTP Authentication, DOM Storage, Flash cookies, SSL and TLS session resumption, HSTS and HPKP supercookies, OCSP, ...

Example: **tracker.com** sets/reads cookies in **bbc.com** and **cnn.com**

Before: **tracker.com** can track the same person on both sites

After: **tracker.com** will see two different cookies

Third party cookies are stored with a tag of the first party (e.g., **bbc.com.tracker.com** and **cnn.com.tracker.com**)

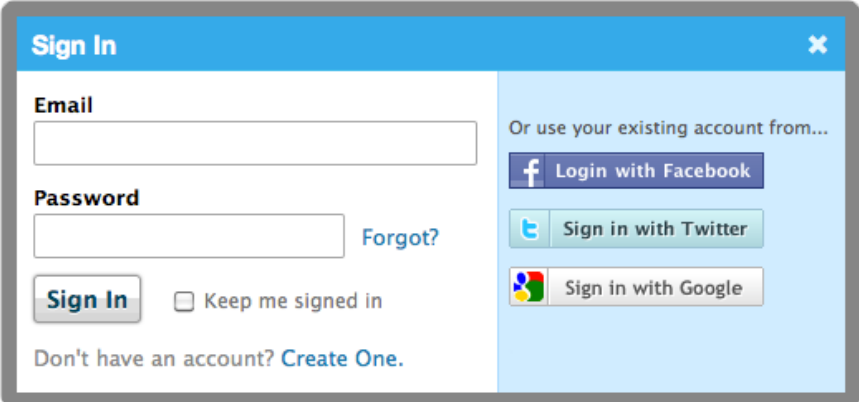

Single Sign-on/Social Login

Pros

- Convenience – fewer passwords to remember
- Rich experience through social features
- Outsource user registration and management

Cons

- Same credentials for multiple sites
- User tracking
- Access to user's profile

The image shows a 'Sign In' form with a blue header and a light blue background. On the left, there are input fields for 'Email' and 'Password', a 'Forgot?' link, a 'Sign In' button, and a checkbox for 'Keep me signed in'. At the bottom left, it says 'Don't have an account? [Create One.](#)'. On the right, under the heading 'Or use your existing account from...', there are three social login buttons: 'Login with Facebook', 'Sign in with Twitter', and 'Sign in with Google'.

Attention, Shoppers: Store Is Tracking Your Cell

Save

More

Like dozens of other brick-and-mortar retailers, [Nordstrom](#) wanted to learn more about its customers — how many came through the doors, how many were repeat visitors — the kind of information that e-commerce sites like Amazon have in spades. So last fall the company started testing new technology that allowed it to track customers' movements by following the Wi-Fi signals from their smartphones.

But when Nordstrom posted a sign telling customers it was tracking them, shoppers were unnerved.

"We did hear some complaints," said Tara Darrow, a spokeswoman for the store. Nordstrom ended the experiment in May, she said, in part because of the comments.

Nordstrom's experiment is part of a movement by retailers to gather data about in-store shoppers' behavior and moods, using video surveillance and signals from their cellphones and apps to learn

Brick-and-mortar stores are looking for a chance to catch up with their online competitors by using software that allows them to watch customers as they shop, and gather data about their behavior. Video by Erica Berenstein on July 14, 2013.

Once the stuff of science fiction, facial-scanning cameras are becoming a part of daily life in China, where they're used for marketing, surveillance and social control. Video: Paolo Bosonin. Photo: Qilai Shen/Bloomberg
