</table>
10 petaFLOPS  Titan supercomputer (released in 2012)

- $10^{15}$ floating point ops per second

18,688 AMD Opteron 6274 16-core CPUs
18,688 Nvidia Tesla K20X GPUs
Compute, compute, compute

Examples:

- S3D, a project that models the molecular physics of combustion, aims to improve the efficiency of diesel and biofuel engines.
- Denovo simulates nuclear reactions with the aim of improving the efficiency and reducing the waste of nuclear reactors.
- WL-LSMS simulates the interactions between electrons and atoms in magnetic materials at temperatures other than absolute zero.
- Bonsai is simulating the Milky Way Galaxy on a star by star basis, with 200 billion stars.
- Non-Equilibrium Radiation Diffusion (NRDF) plots non-charged particles through supernovae with potential applications in laser fusion, fluid dynamics, medical imaging, nuclear reactors, energy storage and combustion.
Numbers, lots of them
- Titan’s I/O subsystem is capable of pushing around 240 GB/s of data
- that’s a lot to visualize

Example: a visualization of the Q Continuum simulation for cosmology
More Examples

Nuclear, Quantum, and Molecular Modeling

Structures, Fluids and Fields

Advanced Imaging and Data Management
Surface Rendering with vTK
(The Visualization Toolkit)

Volume Rendering
Where to Visualize All This?
CAVE
The Stony Brook Immersive Cabin
CAVE
Microtomography
(BNL, soil sample)
Projector based system

- 5 walls, 12’ × 12’ footprint, 8’ tall
- difficult to scale up to Giga-pixel range
Can We Get Bigger?

(yes we can)
Visualization

- 30’×40’×11’ environment
- 416 UQXGA LCD Displays
  - 2,560×1,440 resolution over 50’-100’ DisplayPort cables
  - fast response time, wide viewing angles, good dynamic range
- 20-node GPU cluster, each node equipped with:
  - 2× Six-core CPUs, 48 GB Ram
  - 4× AMD FirePro V9800 with 4GB Ram and 6 DisplayPort outputs each
  - AMD S400 hardware video synchronization card
  - 40Gb Infiniband adapter
  - 1TB storage
- In total:
  - 1,533,542,400 pixels (1.5 Gigapixel) over 6 miles of DisplayPort cables
  - 240 CPU cores: 2.3 TFLOPs peak performance, 20 TB distributed memory
  - 80 GPUs: 220 TFLOPs peak performance, 320 GB distributed memory
Automatic Door

3×5 section of displays
Visually indistinguishable from rest of display
- allows for a fully enclosed visualization environment
Reality Deck Tracking System

24-camera infrared optical system from OptiTrack
24.4 channel professional-grade system
Positional audio with real-time ambisonics
- using the Rapture3D OpenAL driver
User can make visual queries at an instant
- walk up to obtain more detail
- just like in real life – hence the Realty Deck
- 20/20 visual acuity at 1.5’-2’ away
Dubai dataset

- 45 Gigapixels, 180° field of view
Shuttle Radar Topography Mission dataset
Terrain Modeling
3D Relief Map
Sea level simulation
Say, you want to simulate the airflow around an airplane wing

- where is the flow most interesting?
- right, close to the surface
Make the simulation lattice densest along the surface

Regular $\rightarrow$ irregular grids
Structured grid
- more or less a bent regular grid

Unstructured grid
- collection of vertices, edges, faces and cells whose connectivity information must be explicitly stored
THE BLUNTFIN DATASET

Mapping flow strength to color

Rendering by cell traversal
- go from cell to cell
- composite colors and opacities
Flow Visualization

Also called vector field visualization
Perform an integration through the vector field
  - color maps to temperature
Connect two streamlines

- the center streamline gives direction, the other two indicate the twisting
Connect three or more streamlines
Stream Surfaces

Sweep a line segment through the vector field
Smoke is injected into the flow field and compresses/expands due to the vector field
Seek to give a more global view of the vector field

Hedgehogs
- oriented lines spread over the volume, indicating the orientation and magnitude of the flow
- do not show directional information

Glyphs, arrows
- icons that show directions, but tend to clutter the display
**Line Integral Convolution (LIC)**

**Input:**
- a 2D vector field
- an image that will be “smeared” according to the stream lines described by the vector field

**Diagram:**
- Input vector field
- Stream line
- Filter aligned with the stream line
- Output image = line-integrated white noise image

**Process:**
For each output pixel \((x, y)\):
- Follow the stream line forward for some distance \(\Delta s\)
- Multiply each pixel value by a 1D filter kernel and add
- Follow the stream line backward for some distance \(\Delta s\)
- Multiply each pixel value by a 1D filter kernel and add
- Follow the stream line backward for some distance \(\Delta s\)
LINE INTEGRAL CONVOLUTION (LIC)

a flower image with different vector fields

a simple motion vector field over the hand

using vector magnitude to determine $\Delta s$

mapping LIC onto an object surface
Textured Splats

- Embed flow field vector icons into a splat
  - this enables smooth blending of neighboring icons

- Create a table of texture splats with varying icon distribution (to prevent regular patterns)
- For a given location, select a random splat and rotate corresponding to the flow field direction
- Since the flow field is 3D, the component of the vectors that is parallel to the screen varies
- Need to provide splats that accommodate for vector foreshortening when the flow heads towards us

- Animated display
  - store a splat table with vector icons that are cyclically shifted from left to right
  - cycle through this table when picking splats to update the animated display
Textured Splats Examples
VTK
- The Visualization Toolkit library
- developed by Kitware

Paraview
- built on top of VTK
- open-source
- multi-platform
- developed by Sandia & Los Alamos National Labs

VisIt
- open source
- developed by Lawrence Livermore National Lab
