VISUALIZATION & VISUAL ANALYTICS

VISUALIZATION OF HIERARCHIES

KLAUS MUELLER

COMPUTER SCIENCE DEPARTMENT
STONY BROOK UNIVERSITY

Lecture	Topic	Projects
1	Intro, schedule, and logistics	
2	Applications of visual analytics, basic tasks, data types	
3	Introduction to D3, basic vis techniques for non-spatial data	
4	Data assimilation and preparation	Project #1 out
5	Bias in visualization	
6	Data reduction and dimension reduction	
7	Visual perception and cognition	
8	Visual design and aesthetics	Project #1 due/Project #2 out
9	High-dimensional data vis. & dimensionality reduction	
10	Visual design and aesthetics	
11	Cluster analysis and dimension reduction	
12	Cluster analysis and dimension reduction	
13	Cluster analysis and dimension reduction	Project #2 due
14	Foundations of scientific and medical visualization	Project #3 out
15	Computer graphics and volume rendering	
16	Scientific and medical visualization	Project #3 due/Final project proposal call
17	Illustrative rendering	
18	Principles of interaction	
19	Visual analytics and the visual sense making process	Final project proposal due
20	Midterm #1	
21	Midterm discussion	
22	Tasks, VA design and evaluation with user studies	
23	Visualization of time-varying, time-series & streaming data	Final project prelim report due
24	Visualization of geospatial data	
25	Visualization of graphs and hierarchies	
26	Memorable vis., visual embellishments, infographics	
27	Midterm #2	
	Final project presentations	Final Project slides, video, report due

HIERARCHIES = TREES

TREE – A NATURAL METAPHOR

Mapping publications to a tree

- major leaves are papers
- minor leaves are co-authors
- height is time
- fruit are comments
- size or color is number of paper's citations
- journal papers on right side
- conference papers left side

PRODUCTIVE VS. UNPRODUCTIVE RESEARCHERS

Productive

Unproductive

BOTANICAL-INSPIRED VISUALIZATIONS

Visualizing hard drives with tree cartoons

one file

many files

BOTANICAL-INSPIRED VISUALIZATIONS

Color maps to file type

- blue are pdf files, red are image files

CONVENTIONAL

Standard Node-Edge layout for a hierarchical network

- 3 levels
- color maps to quantitative information (here population)

DENDROGRAM

Typically used to depict classification hierarchies

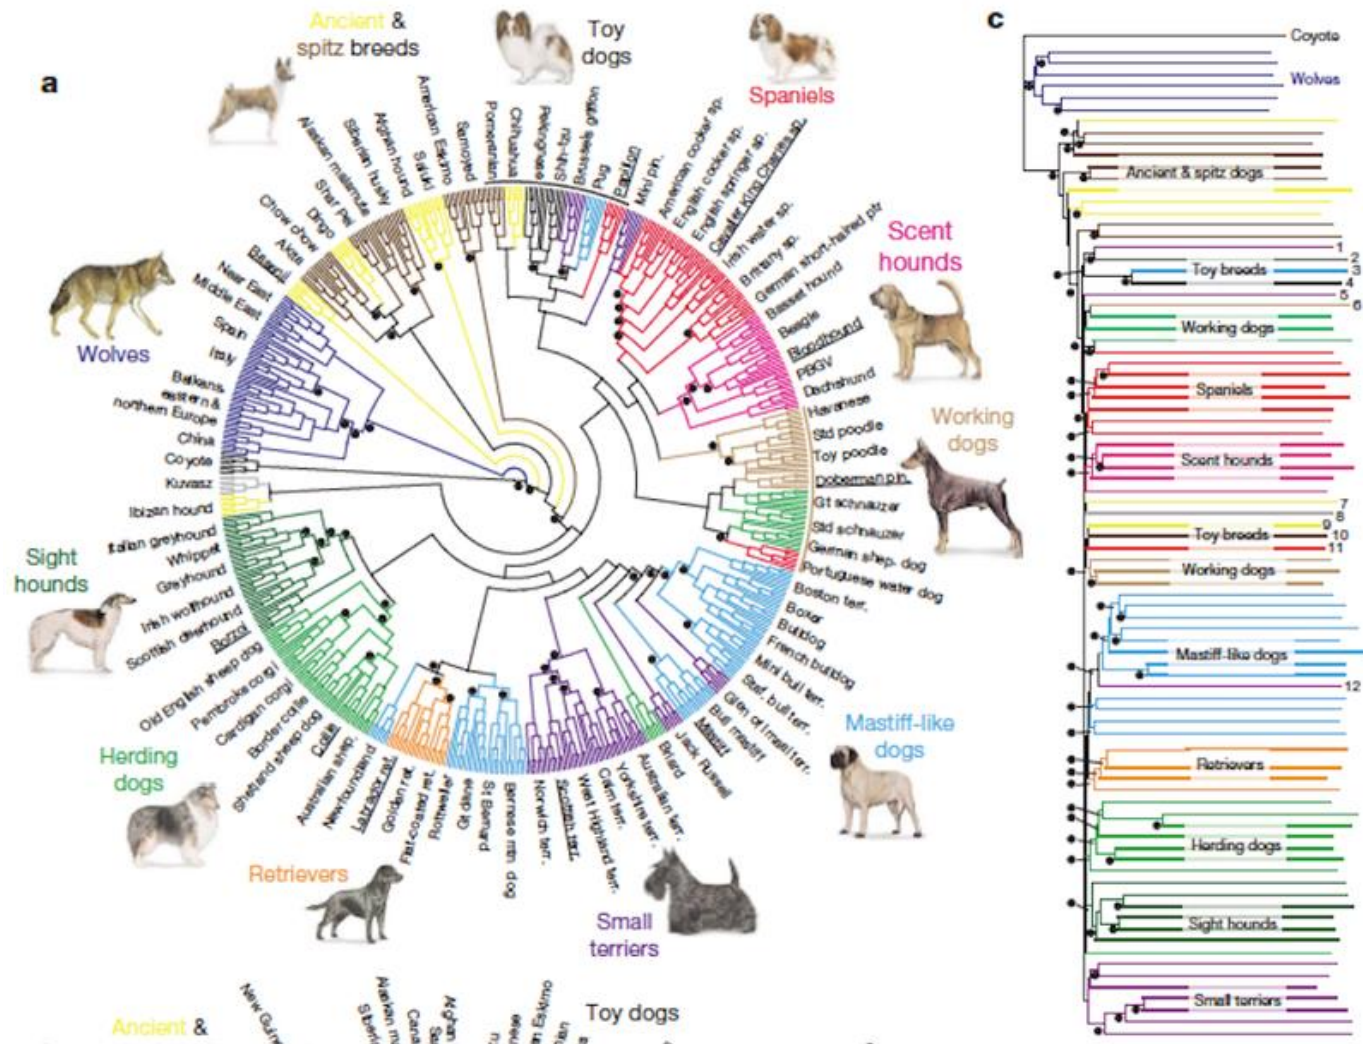

- split-off points
visualize proximity

BIRDS AND DINOSAURS

CIRCLES ARE MORE SPACE-EFFICIENT

CHORD DIAGRAMS

Represents flows or connections between several entities

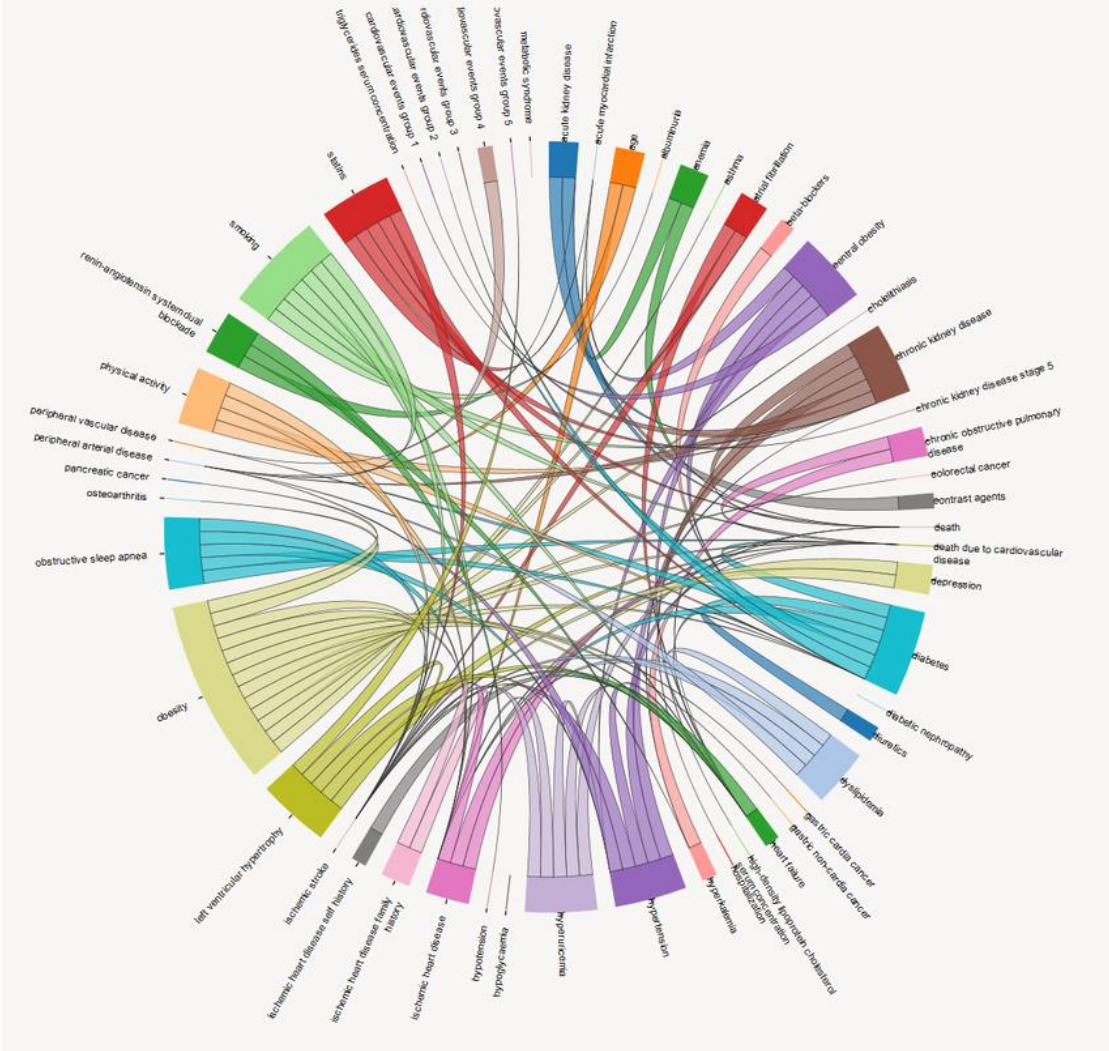

- for example the number of people migrating from one country to another

MORE COMPLEX CHORD DIAGRAM

Can we make it easier to read?

- yes
- via edge bundling

HIERARCHICAL CHORD DIAGRAM

Hierarchy of the Flare ActionScript visualization library

- elements are organized in several folders, such as query, data, scale...
- each folder is then subdivided in subfolders and so on.
- can be visualized as a radial dendrogram

HIERARCHICAL CHORD DIAGRAM

Visualize dependencies in the library

bad: straight line

better: follow a hierarchical edge bundling line

EDGE BUNDLING

Apply the bundling to every adjacency connection of the dataset

- show the hierarchy of the dataset
- decrease the clutter as much as possible
- bundling the electrical wires together in order to reduce clutter
- and fan them out at their terminus in order to connect them to the terminals

RADIAL PLOTS AND EDGE BUNDLES

Original Graph

RADIAL PLOTS AND EDGE BUNDLES

Original Graph

Extracted Hierarchy

Fixed Root

Fixed Depth

Edge Bundles

Kenneth Lay

Selected visualization

LEVELS OF EDGE BUNDLING

Edges are represented by splines with tension β

Setting β

- low values mainly provide low-level, node-to-node connectivity information
- high values provide high-level information

EDGE BUNDLING EXAMPLE

Software system call graph

- green is caller, red is callee

balloon layout (isolated processes)

radial layout (more integrated)

WITHOUT EDGE BUNDLING

balloon layout

radial layout

CURVED EDGES MODELED AS SPLINES

Curved edges are represented as *splines*

- a spline is a smooth curve defined by some control points
- moving the control points changes the curve

Interpolation

Bézier (approximation)

BSpline
(approximation)

PRIMER: UNIFORM CUBIC B-SPLINE

A B-Spline curve is defined as follows: $X(t) = \sum_{k=0}^n P_k B_{k,d}(t)$

- n is the total number of control points
- d is the order of the curves, $2 \leq d \leq n+1$, d typically 3 or 4
- $B_{k,d}$ are the uniform B-spline blending functions of degree $d-1$
- P_k are the control points
- Each $B_{k,d}$ is only non-zero for a small range of t values, so the curve has local control

$$x(t) = \frac{1}{6} \begin{bmatrix} P_0 & P_1 & P_2 & P_3 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 0 & 4 \\ -3 & 3 & 3 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} t^3 \\ t^2 \\ t \\ 1 \end{bmatrix}$$

Or in matrix form:

- t is the *parametric variable*
- defined on $[0,1]$

PRIMER: UNIFORM CUBIC B-SPLINE

Four basis functions B must be active to define the B-Spline curve

PRIMER: UNIFORM CUBIC B-SPLINE

The locations of the control points scale the basis functions

- in this simple example we see a continuous 1D function generated from 6 control points and basis functions

The curve can't start until there are 4 basis functions active

CUBIC B-SPLINE ANIMATED

APPLICATION TO PARALLEL COORDINATES

One straightforward way of reducing clutter is to replace polylines with polycurves:

Each line segment is replaced with an end-point interpolating, quadratic B-spline. A tension parameter can be controlled by the user.

EDGE BUNDLING (CONT.)

Let m be the mid-point in viewport coordinates of $v_{i,j}$ and $v_{i+1,j}$, end-points of a line segment

Let c_k be the cluster to which this segment belongs and $c_{k,\mu}$ be its mid-point in viewport coordinates

Let λ and β be tension parameters (usually $\lambda = 0.75$) and $0 \leq \beta \leq 1$ is set by the user

The control points of the spline are given by:

- $(-1, v_{i,j})$
- $(0, \beta m + (1 - \beta)p)$
- $(1, v_{i+1,j})$

EDGE BUNDLING (CONT.)

The tension can be changed to control the amount of clutter reduction

In our implementation, the λ parameter is fixed, but the β parameter can be changed in the GUI

Examples of medium and low tension, respectively:

CLUSTER RENDERING

Recall that clusters are often rendered as heavy line segments on top of the dataset

In IPC we render the clusters as polygonal meshes

They help to show the ranges of each cluster along axes

The vertical “spread” can be controlled by the user

ALPHA (OPACITY) BLENDING

Draw curves at different opacities

- long curves: low opacities (high transparencies)
- short curves: high opacity (makes short curves visible)

alpha blending disabled

alpha blending enabled

ALPHA (OPACITY) BLENDING

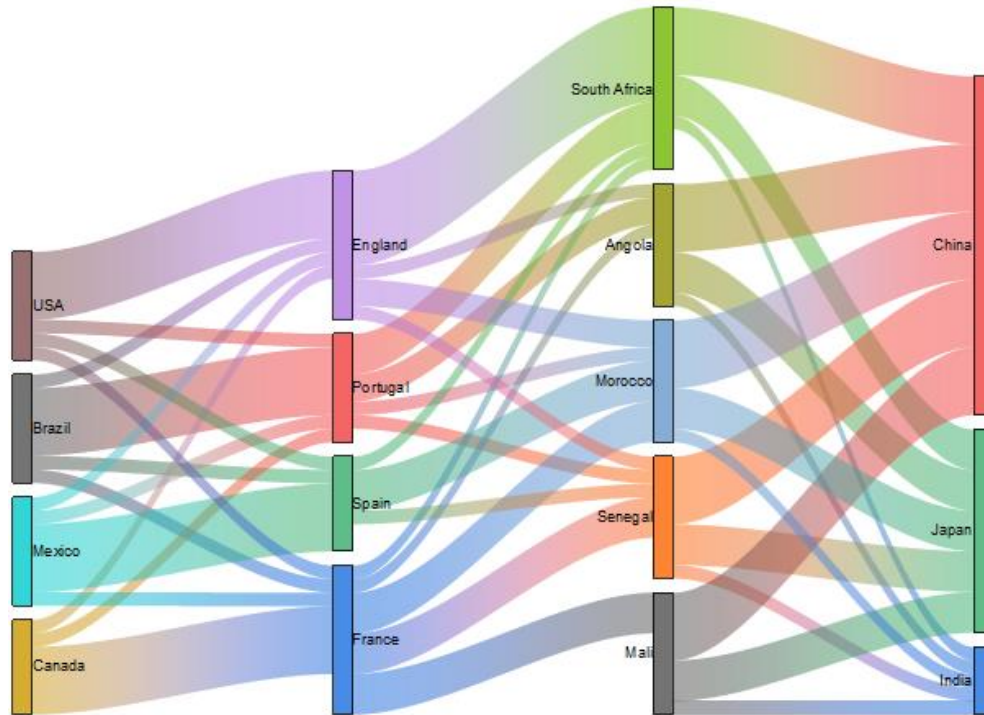

Alpha blending also enables visualization of sub-bundles and differentiation of lines

alpha blending disabled

alpha blending enabled

SANKEY DIAGRAM

Another bundling technique

- flow diagram
- the width of the arrows is proportional to the flow rate

Use cases:

- where money came from and went to (budgets, contributions)
- flows of energy from source to destination
- flows of goods from place to place

The sunburst chart illustrates the hierarchical structure of the Flare.js library. The central node is 'flare', which branches into five main categories: 'vis', 'data', 'controls', 'animate', and 'query'. Each category is further subdivided into specific modules and classes. The 'vis' category is the largest, followed by 'data', 'controls', 'animate', and 'query'. The chart uses a color-coded system to distinguish between different levels of the hierarchy.

Category	Sub-category	Module/Class
vis	operator	NodeLinkTreeLayout
		RadialTreeLayout
		CirclePackingLayout
		CircleLayout
		TreeMapLayout
		StackedTreeLayout
		ForceDirectedLayout
		Layout
		AxisLayout

SUNBURST WITH PARTITION OF UNITY

SAME DATA WITH TREEMAP

TREEMAP CONSTRUCTION

TREEMAP FOR STOCK PORTFOLIO

Size is mapped to market cap, yellow boxes are investor's holdings

CUSHION TREEMAP

Advantages

- due to perceived discontinuity in texture between nodes, lines are no longer necessary to separate nodes
- more of the space can be used for the actual node display
- much smaller nodes can be shown than in a flat treemap

TREE MAP FOR DISK DRIVES

Used in programs like

- WinDirStat (Windows)
- KDirStat (Linux)
- DiskInventory (Mac)

TREEMAP VARIATIONS

SliceAndDice

Squarified

Strip

order	ordered	unordered	ordered
aspect ratios	very high	lowest	medium
stability	stable	medium	medium

Squarified treemap is preferred

- it's difficult to visually compare long slivery tiles with tiles that have a more even aspect ratio
- a squarified treemap makes the map more globally comparable

Voronoi treemap

- based on Voronoi tessellation
