But we decided to always evaluate polynomials of degree bound 2 at $x = 1$ and $x = -1$.

So, $x_0^2 = 1 \Rightarrow x_0 = 1$ and $x_1^2 = -1 \Rightarrow x_1 = \sqrt{-1} = i$.

Given a Polynomial of Degree Bound 8 Find 8 Distinct Points to Efficiently Evaluate it at

$$A(x) = a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7$$

$$A_{\text{even}}(x) = a_0 + a_2x + a_4x^2 + a_6x^3$$

 $x_1 A_{\text{odd}}(x_1^2)$
 $x_2 A_{\text{odd}}(x_2^2)$
 $x_3 A_{\text{odd}}(x_3^2)$

Observe that we evaluate both $A_{\text{even}}(x)$ and $A_{\text{odd}}(x)$ at $x = x_0^2, x = x_1^2, x = x_2^2$ and $x = x_3^2$.

But we decided to always evaluate polynomials of degree bound 4 at $x = 1, x = i, x = -1$ and $x = -i$.

So, $x_0^2 = 1 \Rightarrow x_0 = 1, x_1^2 = i \Rightarrow x_1 = \frac{1+i}{\sqrt{2}}, x_2^2 = -1 \Rightarrow x_2 = i$, and $x_3^2 = -i \Rightarrow x_3 = \frac{-1+i}{\sqrt{2}}$.

How to Find all n^{th} Roots of Unity

The n^{th} roots of unity are: $1, \omega_n, (\omega_n)^2, (\omega_n)^3, \dots, (\omega_n)^{n-1}$,

where $\omega_n = \cos \frac{2\pi}{n} + i \sin \frac{2\pi}{n} = e^{\frac{2\pi i}{n}}$ is known as the primitive n^{th} roots of unity.

The result above can be derived using Euler's Formula.

Euler's Formula: For any real number α , $\cos \alpha + i \sin \alpha = e^{i\alpha}$

Euler's formula follows very easily from the following three power series each of which holds for $-\infty < \alpha < +\infty$:

$$\cos \alpha = 1 - \frac{\alpha^2}{2!} + \frac{\alpha^4}{4!} - \frac{\alpha^6}{6!} + \frac{\alpha^8}{8!} - \dots$$

$$\sin \alpha = \alpha - \frac{\alpha^3}{3!} + \frac{\alpha^5}{5!} - \frac{\alpha^7}{7!} + \frac{\alpha^9}{9!} - \dots$$

$$e^{\alpha} = 1 + \alpha + \frac{\alpha^2}{2!} + \frac{\alpha^3}{3!} + \frac{\alpha^4}{4!} + \frac{\alpha^5}{5!} + \frac{\alpha^6}{6!} + \frac{\alpha^7}{7!} + \frac{\alpha^8}{8!} + \dots$$

How to Find all n^{th} Roots of Unity

Observe that for (any) real numbers α and p ,

$$(\cos \alpha + i \sin \alpha)^p = (e^{i\alpha})^p = e^{i(p\alpha)} = \cos(p\alpha) + i \sin(p\alpha)$$

Also observe that for any integer k , $\cos(k \times 2\Pi) + i \sin(k \times 2\Pi) = 1 + i \times 0 = 1$

Then the n^{th} root of 1 (unity) is $= 1^{\frac{1}{n}} = (\cos(k \times 2\Pi) + i \sin(k \times 2\Pi))^{\frac{1}{n}} = \cos\left(k \times \frac{2\Pi}{n}\right) + i \sin\left(k \times \frac{2\Pi}{n}\right)$

Observe that $\cos\left(k \times \frac{2\Pi}{n}\right) + i \sin\left(k \times \frac{2\Pi}{n}\right)$ takes n distinct values for $0 \leq k < n$, and then simply repeats those values for $k < 0$ and $k \geq n$.

When $k = 1$, we have $\cos\left(k \times \frac{2\Pi}{n}\right) + i \sin\left(k \times \frac{2\Pi}{n}\right) = \cos\left(\frac{2\Pi}{n}\right) + i \sin\left(\frac{2\Pi}{n}\right) = \omega_n = \text{primitive } n^{\text{th}} \text{ root of 1.}$

Clearly, for any k , $\cos\left(k \times \frac{2\Pi}{n}\right) + i \sin\left(k \times \frac{2\Pi}{n}\right) = \left(\cos\left(\frac{2\Pi}{n}\right) + i \sin\left(\frac{2\Pi}{n}\right)\right)^k = (\omega_n)^k$

Hence, $1^{\frac{1}{n}} = \cos\left(k \times \frac{2\Pi}{n}\right) + i \sin\left(k \times \frac{2\Pi}{n}\right) = (\omega_n)^k$, for $k = 0, 1, 2, \dots, n - 1$.

In other words, the n^{th} roots of 1 (unity) are: $1, \omega_n, (\omega_n)^2, (\omega_n)^3, \dots \dots \dots, (\omega_n)^{n-1}$
