Patents

1. Registration of Scanned Organs Acquired from Different Orientations

Inventor: Arie E. Kaufman, Xianfeng Gu and Wei Zeng, Joseph Marino, Krishna C. Gurijala
Pub No.: US20130170726 A1, July 4, 2013

Abstract: Disclosed is a method for registration of scans of an object, such as a biological organ, by obtaining scans of the object that includes a first scan obtained with the object in a first position and a second scan obtained with the object in a second position different from the first position, extracting landmarks within each of the scans, flattening each of the scans, detecting feature points of each of the flattened scans, matching corresponding feature points of each of the flattened scans, performing a harmonic map registration using the matched corresponding feature points and displaying the registered scans.

2. System and method for context preserving maps of tubular structures

Inventor: Arie E. Kaufman, Joseph Marino, Xianfeng Gu and Wei Zeng

Pub No.: WO2013059807 A1, Apr 25, 2013

Abstract: A computer-based method for generating a context preserving mapping of tubular structures represented by a 3D dataset having the steps of projecting a skeleton of a 3D tubular structure on to a 2D plane, and adjusting the projected skeleton to correct projection imbued distortion in skeleton length. The 2D projected skeleton is processed to remove intersections, and a surface boundary around the 2D skeleton is determined for the map. The 3D surface of the skeleton is mapped to match the 3D boundary to create a 3D map of the tubular structure.

3. System and Method for Computer Aided Polyp Detection

Inventors: Arie E. Kaufman, Wei Hong, Xianfeng Gu, Feng Qiu

Pub No.: US 2010/0215226 A1, Aug 26, 2010; Licensed by Siemens Healthcare Sector of Germany

Abstract: In the present methods, the automatic detection of polyps is converted into a 2D pattern recognition problem using conformal mapping and direct volume rendering. The colon surface is first segmented and extracted from the CT data set of the abdomen, which is then mapped to a 2D plane using conformal mapping. Ray casting is used to determine sub-surface density values and the flattened image is rendered using a volume rendering technique with a translucent electronic biopsy transfer function. Polyp candidates are detected by a clustering method which identifies regions of elevated sub-surface density. The potential for false positives is reduced by analyzing the volumetric shape and texture features of the polyp candidate regions.

4. Method and Apparatus for Absolute-Coordinate Three-Dimensional Surface Imaging

Inventors: Song Zhang, Shing-Tung Yau, Xianfeng Gu, Yalin Wang, Dale Royer

Pub No.: US2009/0238449 A1, Nov 9, 2006

Abstract: A method and associated apparatus for capturing an image of a 3D object which encodes the surface geometry of at least a portion of the object, comprising: 1. projecting a plurality of fringe patterns onto the object; 2. capturing phase alterations in reflections of the fringe patterns from the object; 3. projecting a uniform image onto the object; 4. capturing a reflection of the uniform image from the object; and 5. combining captured phase alterations and captured uniform image reflection on a pixel-by-pixel basis, thereby forming a holimage representation of the object.

5. Analysis of Geometric Surfaces by Conformal Structure

Inventors: Shing-Tung Yau, Xianfeng Gu, Yalin Wang

Pub No.: US 2006/0013505 A1, Nov 6, 2003

Abstract: A method for analyzing, classifying, and recognizing geometric surfaces is disclosed. Geometric surfaces are treated as Riemann manifolds and the conformal structure corresponding to the surfaces is calculated. The conformal structure of the surface contains the intrinsic geometric information about the surface, but in a much more compact format as compared to other representations. Conformally mapping the surface to a canonical parameter domain, such as a disk, sphere, or plane retains the geometric information of the surface, and renders the calculation of conformal structure much easier. Various applications enabled by such a conformal representation include surface matching, surface cataloging, surface recognition, animation and morphing between surfaces, and other mathematical analysis.

6. Fingerprint Recognition System

Inventor: Shing-Tung Yau, Xianfeng Gu, Zhiwu Zhang

Patent No.: 6876757, Apr 5, 2005

Abstract: A method of analyzing and recognizing fingerprint images that utilizes vector processing of a vector field that is defined as the tangential vector of the fingerprint ridge curves is disclosed. The raw fingerprint image is divided into blocks, filtered to remove noise, and the orientation direction of each block is found. This allows the ridge curves to be enhanced and approximated by piece-wise linear approximations. The piece-wise linear approximations to the ridge curves allow the minutiae to be extracted and classified and a fingerprint minutiae template to be constructed. An enrollment process gathers multiple fingerprint images, creates fingerprint minutiae templates corresponding to the acquired fingerprint images, and stores the templates and other data associated with the respective individual or the enrolled fingerprint in a fingerprint database.
