

CSE570 Spring 2020 Wireless and Mobile Networks

IoT/Sensor Networks

Slides borrowed from <https://www3.nd.edu/~cpoellab/teaching/cse34468/schedule.html>

1

What is IoT?

2

How Does My Fridge Do That?

- You are leaving the home (sense user)
- There's no milk in fridge (sense object)
- Use this information to make a decision (process)
- Inform user of decision (communicate)

3

How Does My Fridge Do That?

- **You are leaving the home (sense user)**
 - What type of sensor?
 - Distinguish between parent and child
 - Identify reason for leaving home
 - Identify other contexts (e.g., store hours)
- There's no milk in fridge (sense object)
- Use this information to make a decision (process)
- Inform user of decision (communicate)

4

How Does My Fridge Do That?

- You are leaving the home (sense user)
- **There's no milk in fridge (sense object)**
 - What type of sensor?
 - Is milk needed?
 - No milk or "little" milk? (prediction)
- Use this information to make a decision (process)
- Inform user of decision (communicate)

5

How Does My Fridge Do That?

- You are leaving the home (sense user)
- There's no milk in fridge (sense object)
- **Use this information to make a decision (process)**
 - Where is processor?
 - What are the rules?
 - Fixed rules versus dynamic rules (learning)
- Inform user of decision (communicate)

6

How Does My Fridge Do That?

- You are leaving the home (sense user)
- There's no milk in fridge (sense object)
- Use this information to make a decision (process)
- **Inform user of decision (communicate)**
 - How?
 - When?
 - Privacy?
 - Subtleness?
 - Information overflow?

7

What is IoT?

Physical object ("thing")

+

Controller ("brain")

+

Sensors

+

Actuators

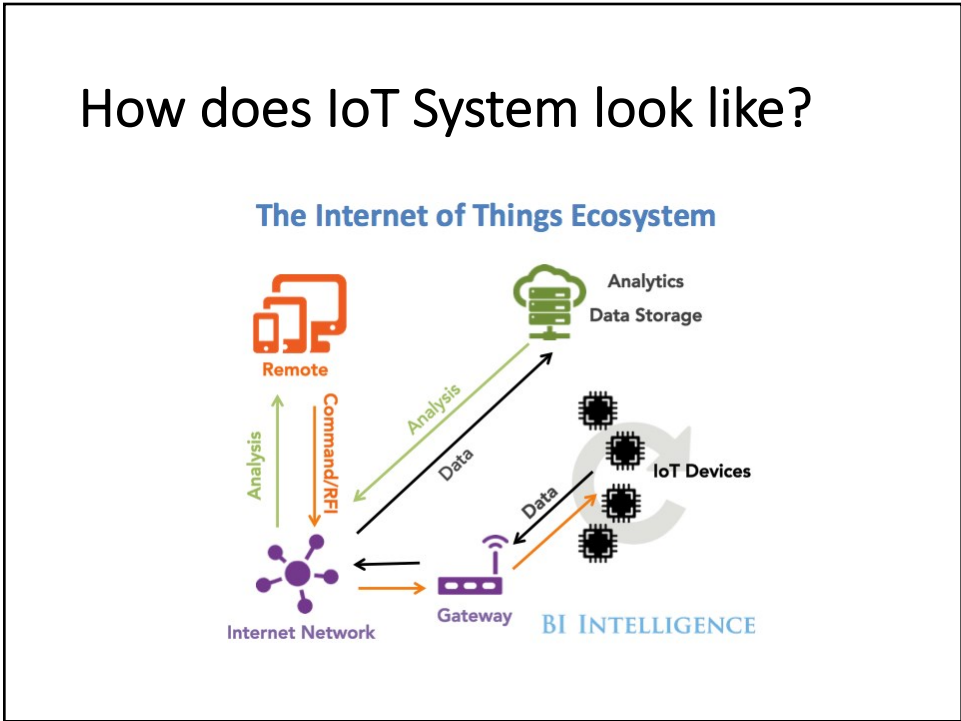

+

Networks (Internet)

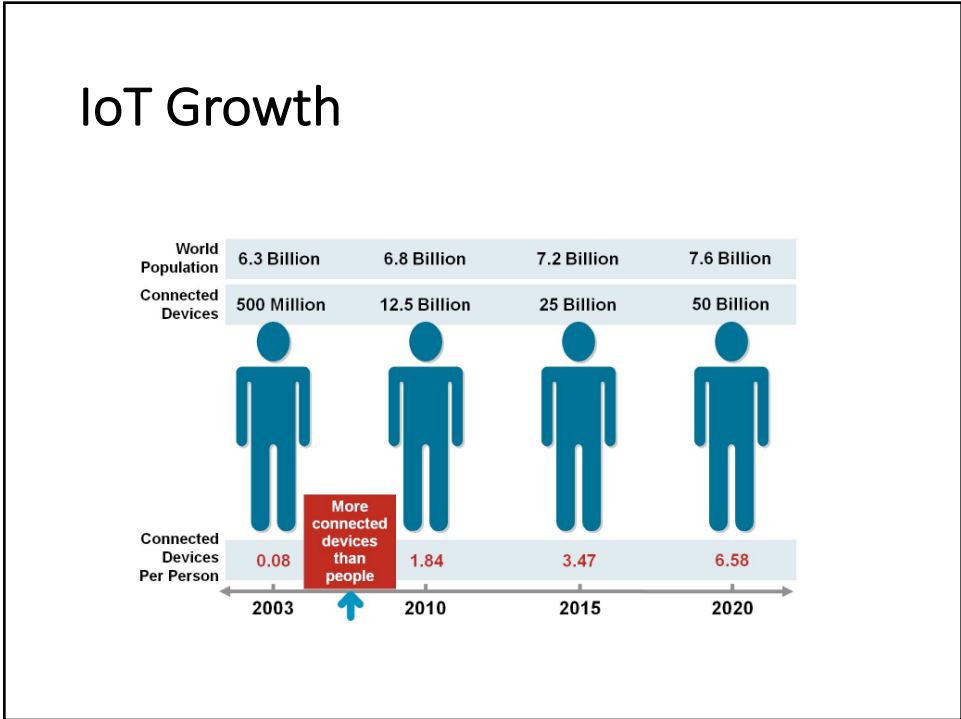

8

How does IoT System look like?

9

IoT Growth

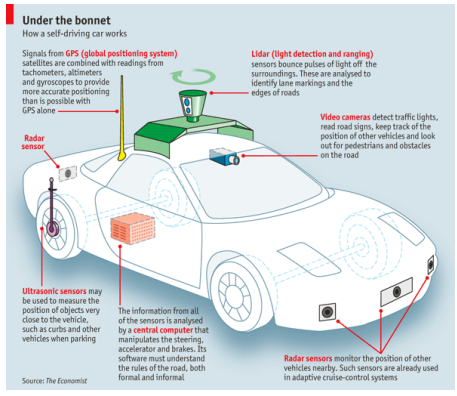

10

Some IoT Devices

11

IoT in work

Connected Roadways

Connected buildings

12

IoT in work

The connected cow

Necklace
Connecterra, a Dutch company, makes Fitbit-style necklaces that monitor a cow's movement and feeding habits. The sensor can be used to detect health problems and to tell when the cow is in heat, so that insemination can happen at an optimum time.

Ear marker
Well Cow, a British company, has developed a collar that is inserted into the cow's ear to monitor quality levels. This helps detect digestive problems.

Pedometer
A device, based in Israel, makes a pedometer for cows. Cows typically increase their walking as they come into estrus, so the pedometer alerts farmers to the best time for insemination.

Udder sensors
Automatic milking systems, such as US-based Lely's AMSTAR, can be equipped with sensors to monitor the health of the milk and check for signs of mastitis.

Tail movements
Fitbit-style, an Irish company, made a tail-mounted sensor that attaches to the tail. It measures tail movements triggered by labour contractions, and sends a farmer an SMS alert 15 minutes before a cow is due to calve.

One of the most important issues is to control and increase the quality of milk through IoT!

HOME SMART HOME

SMART GRID

A network for the future — a network of integrated technologies that can monitor and control:

- Smart appliances**: Can shut off or respond to grid frequency fluctuations.
- Demand management**: Can shut off or adjust to grid load peaks to save money.
- Smart meters**: Measure energy consumption in real-time.
- Smart buildings**: Optimize building and occupancy-related energy use.
- Smart grids**: Energy generated at all grid levels (from local to long distance) for real-time.
- Renewables**: Energy from wind, geothermal, and solar power.
- Industrial plants**: Control power plant.
- Control power plant**: Control power plant.

13

IoT Enablers

- Portability
- Miniaturization

50mm x 50mm

35mm x 35mm

15mm x 15mm

14

IoT Enablers

- Low power and Low heat

Low power architectures
Low power radios
Sleep modes
Energy harvesting

Bluetooth

- Connectivity

15

Key Component

Sensor

- A sensor is a device that receives a stimulus and responds with an electrical signal.
- Sensors talk to each other.
- Only a few sensors are connected to the internet through gateway/router.
- The data generated by sensors can grow huge.
 - GBs, TBs per minute, day etc

Wireless

16

IoT/Wireless Sensor Networks

- What are the important features of WSNs?
- Fault tolerance/reliability
 - Network should be robust to individual node failures
 - Failures due to running out of energy, hardware failures, malicious intercept of sensor, etc.
- Scalability
 - Protocols must scale to thousands or millions of sensor nodes
 - Requires intelligent management of high density nodes
- Cost
 - Must have cheap sensors

17

IoT/Wireless Sensor Networks

- Topology
 - Deployment: random or deliberate placement of nodes
 - Changes in topology during network operation
 - New nodes added to the system
 - Nodes failing
 - Environmental changes
- Energy consumption
 - Sensor functions: sensing, communication, data processing
 - All require energy

18

IoT/Wireless Sensor Networks

- Types of network topologies
 - Centralized
 - De-centralized (peer-to-peer)
 - Hybrid
- Mesh Networks
- Ad hoc Networks
- Mobile Ad hoc Networks (MANETs)
 - Definition
 - A collection of wireless mobile hosts forming a temporary network without the aid of any centralized administration or standard support services
 - Often ad-hoc network topology is dynamic—nodes enter and leave the network continuously
 - No centralized control or fixed infrastructure to support network configuration or reconfiguration

Single-hop star topology

Multi-hop mesh topology

Structured grid topology

Hierarchical cluster topology

19

Why Ad hoc Networks

- Setting up of fixed access points and backbone infrastructure is not always viable
 - Infrastructure may not be present in a disaster area or war zone
 - Infrastructure may not be practical for short-range radios; Bluetooth (range ~ 10m)
- Ad hoc networks:
 - Do not need backbone infrastructure support
 - Are easy to deploy
 - Useful when infrastructure is absent, destroyed or impractical

20

MANET Characteristics

- Mobile nodes have limited communication range
 - Reduces battery drain
 - Enables spatial reuse of limited bandwidth → increased network capacity
- To connect all nodes in the network, each node is a
 - Packet source
 - Packet sink
 - Router
- Nodes must route packets for other nodes to keep the network fully connected
- In MANETs, a big problem is how to determine where a destination node is located relative to a sending node

21

MANET Characteristics

- Route-finding is a current area of much research
 - Want to determine an “optimal” way to find “optimal” routes
- Dynamic links
 - Broken links must be updated when a node moves out of communication range with another node
 - New links must be formed when a node moves into communication range with another node
 - Based on this new information, routes must be modified
- Frequency of route changes a function of node mobility

22

MANET Routing

- **Proactive (Table-driven) protocols**
 - Traditional distributed shortest-path protocols
 - Maintain routes between every host pair at all times
 - Based on periodic updates; High routing overhead
 - Example: DSDV (destination sequenced distance vector)
- **Reactive (On-Demand) protocols**
 - Determine route if and when needed
 - Source initiates route discovery
 - Example: DSR (dynamic source routing)
- **Hybrid protocols**
 - Adaptive; Combination of proactive and reactive
 - Example : ZRP (zone routing protocol)

23

MANET Routing

- **Proactive protocols**
 - Always maintain routes
 - Little or no delay for route determination
 - Consume bandwidth to keep routes up-to-date
 - Maintain routes which may never be used
- **Reactive protocols**
 - Lower overhead since routes are determined on demand
 - Significant delay in route determination
 - Employ flooding (global search)
 - Control traffic may be bursty
- Which approach achieves a better trade-off depends on the traffic and mobility patterns

24

Summary

- IoT Applications
- Sensors
- IoT/Senor Networks
- Ad hoc Networks

25

Recent work in IoT Space

- Wireless Networking
- Emerging platforms for IoT
 - LivingIoT
 - Farmbeats

26

LivingIoT – Flying Sensors

- A Flying Wireless Platform on Live Insects

<https://homes.cs.washington.edu/~gshyam/Papers/living-iot.pdf>

27

Drones as Flying Sensors

28

Drones as Flying Sensors

29

Drones consume lots of power

30

Idea: Use live insects to carry wireless sensors

31

Benefits of LivingIoT

- Bio-based solution
- No need for mechanical propulsion
- Bees are introduced on farms for pollination
- Bees sense their environment

32

Bee Carrying Sensors

33

Key Challenges

Size/Weight

Power

~100 mg = 70 mg battery + 30 mg electronics

34

Key Challenges

Can't control bee motion

35

LivingIoT Solutions

- Building lightweight hardware
- 2D location tracking of bees

36

Designing small size and weight

Custom ASIC

- + Lowest power and size
- Needs external components
- Long expensive process
- Not programmable

37

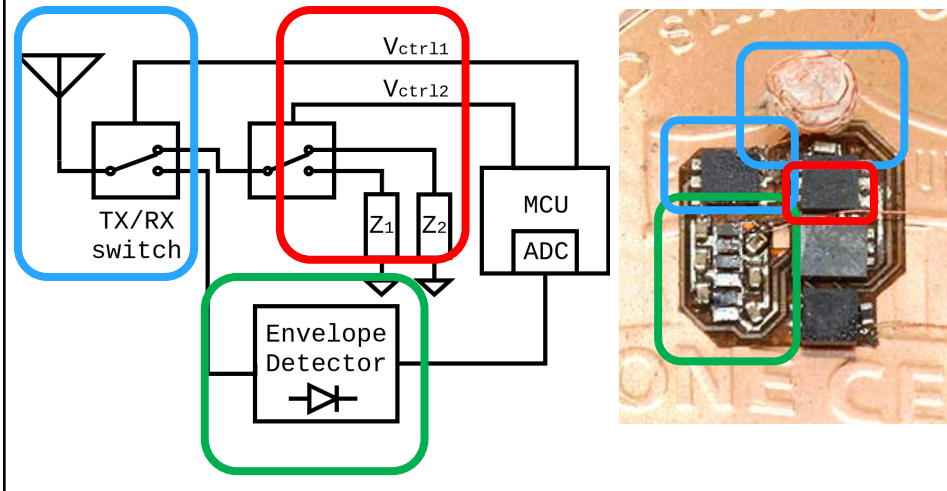

Programmable General-purpose Design

- Programmable microcontroller
- Interfaces with temperature and humidity sensors
- Low range backscatter communication
- Weighs < 30 mg

38

Programmable General-purpose Design

39

LivingIoT Solutions

- Building lightweight hardware
- 2D location tracking of bees

40

Bee Localization

Problem: GPS is power expensive

Solution: Passive receiver circuit

But, no phase info!

41

Extracting Phase from Amplitude

42

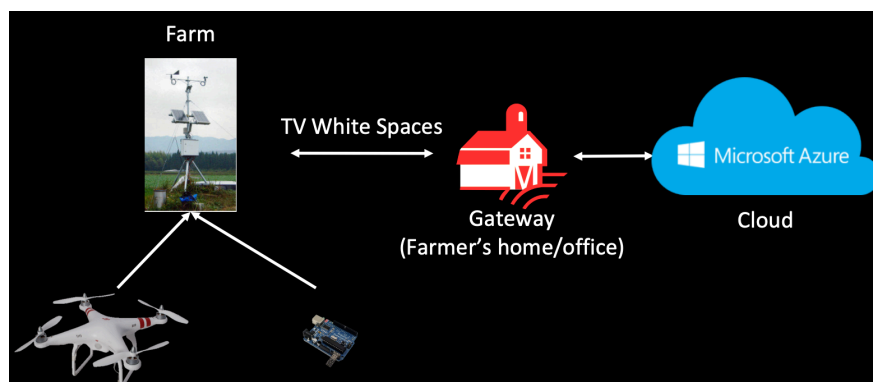

What's Next with LivingIoT

- What other sensors can we use?
- Can we stream sensor data in real time?
- Can we use live insects to build bio-hybrid robots?
- Can we use these technologies to better study insects?

43

Farmbeats

An IoT System for Data-Driven Agriculture

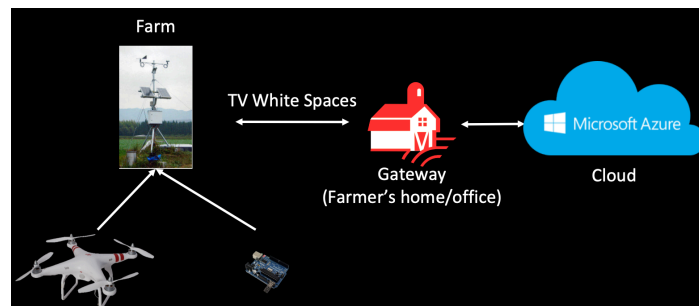

NSDI'17

44

Key Challenges

- Internet Connectivity
- Power Availability
- Limited Sensor placement

45

Deployment

- Six months deployment in two farms: Upstate NY (Essex), WA (Carnation)
- The farm sizes were 100 acres and 5 acres respectively
- Sensors:
 - DJI Drones
 - Particle Photons with Moisture, Temperature, pH Sensors
 - IP Cameras to capture IR imagery as well as monitoring
- Cloud Components: Azure Storage and IoT Suite

46

Deployment

- Used 10 sensor types, 3 camera types and 3 drone versions
- Deployed >100 sensors and ~10 cameras
- Collected >10 million sensor measurements, >0.5 million images, 100 drone surveys
- Resilient to weeklong outage from a thunderstorm
