Why Visual Analytics?

Big Data

12+ TBs of tweet data every day

25+ TBs of log data every day

30 billion RFID tags today (1.3B in 2005)

4.6 billion camera phones worldwide

100s of millions of GPS enabled devices sold annually

76 million smart meters in 2009... 200M by 2014

2+ billion people on the Web by end 2011
Visual Analytics
PROBLEMS WITH SCALABILITY

Must be scalable to

- number of data points
- number of dimensions
- data sources
- diversity of data sources (heterogeneity)
- number of users
- diversity of users and tasks
- quality of the data

*Visual Analytics comes to the rescue...*
Ease understanding of the data by providing an effective visual representation

*Amplify Perception*

*Detect the Expected, Discover the Unexpected™*
Visualization plus...

- interaction (HCI)
- data processing (analytics)
- story telling
- scientific approach

but also...

- intelligent computing (AI, machine learning)
- behavioral psychology (cognitive science, human factors)

Visual Analytics is the science of analytical reasoning supported by a highly interactive visual interface
The Daniel Keim Mantra of Visual Analytics

"Analyze First - Show the Important – Zoom, Filter and Analyze Further - Details on Demand"

The triangle of Visual Analytics (VA)
Intelligence analysis is challenging
Huge amounts of data
Many data types: text, images, video, sensor data, etc.
Uncertainty
Contradictions
Omissions
Low signal to noise ratio (SNR)
Use of Visualization

Visual perception
- high bandwidth
- fast screening of a lot of data
- pattern recognition
- higher-level cognition

Interaction
- direct manipulation
- two-way communication

*Recall intro lecture on the human visual system...*
Use of Visualization

Visual perception
- high bandwidth
- fast screening of a lot of data
- pattern recognition
- higher-level cognition

Interaction
- direct manipulation
- two-way communication

*Recall intro lecture on the human visual system...*

*But... humans are imperfect*
Humans tend to overlook/ignore non-focus (and unexpected) objects even when very close and obvious
  ▪ note the Visual Analytics slogan: Detect the Unexpected

Humans also have limited working memory
  ▪ fine details are quickly forgotten when focus changes
  ▪ big effect in animated or interactive visualizations
  ▪ need to preserve temporal context
Spot a difference?

This is called change blindness
In this video you will do some counting.

It is very important that you get the right number!

Ready?

Video by Dan Simons (U Illinois)
Another distraction experiment

YouTube

Video by Dan Simons (U Illinois)
Thoroughly studied by Dan Simons (U Illinois)
- see http://www.dansimons.com/index.html

Visual Analytics tools
- help human analysts cope with insufficient memory
  → visualizations externalize memory
  → allow humans to perform *visual queries* (see C. Ware book)
- help human analysts deal with change blindness
  → analytics can detect changes
  → visualization can highlight/emphasize these changes
- we have seen many visual tools this semester
  → this lecture is more about strategy building
The Magic Number Seven

- $\pm 2$: the number of things most people can keep in working memory at one time
- famous paper by George A. Miller (1956)
- channel capacity 2.5 bits
- applies to letters, sounds, shapes, colors, etc.
- causes problems for complicated analysis

- reduce the problem by chunking
- words (vs. letters), bytes (vs. bits), clusters (vs. points), categories (vs. individual elements), ...
- hierarchical decomposition, multi level of detail
The Magic Number Seven (7) for visualization

- not more than 7 segments in a pie chart
- not more than 7 colors in a line chart
- and so on
do I need these grid lines? maybe not

“Perfection is achieved not when there is nothing more to add, but when there is nothing left to take away.”
—— Antoine de Saint-Exupery.
Strategies for Dealing with Complexity

Decomposition
- decompose a complex problem into simpler problems
- get your thinking straight in these simpler problems

Externalization
- get the decomposed problem out of your head and down on paper or on a computer screen in some simplified form
- show the main variables, parameters, or elements of the problem and how they relate to each other

Recall principles of information visualization
- overview and detail
- focus and context
- analyze, filter, zoom,...
Mentioned his method of solving decision problems

Why is the decision problem so difficult?
- folks cannot keep all pros and cons in mind at the same time

Solution?
- write down all the pros and cons onto paper in some visible, shorthand form
- allows you make a global judgment effectively
Support visualization with computations for data processing
Form a loop: visualize - refine
Gather (forage) information
Re-represent
  - choose a form that aids analysis
Develop insight
  - through manipulation of representations
Produce results
  - “product”
Use Visualizations to Evoke The Right Thoughts
How Many 9s Do You See?

Do The Right Analytics, Don’t Just Visualize Data
Doubling down on states for strong growth

Maria
Senior Sales Analyst
March 15th, 2012
Today’s question

In which states should we invest additional marketing dollars during the upcoming campaign?

Based upon sales growth potential...
2011 sales per million residents by state (top/bottom 3 labeled)

Top sales states are quite low in sales per million people! Great potential!
Potential sales by state???

+ Is there a better metric?
+ The emphasis is on potential

*Average sale per capita for top states multiplied by
Current population of top sales states*
Sales per State/Per Capita x Capita

2011 sales per state (top/bottom 3 labeled)

ID at $697 0.0%

Top: TX at $467,644 11.6%
Highest growth potential in top 8

+ If we were to pick just one state, California has the greatest potential

+ The next tier is Texas, New York & Florida
