Contents

- Motivation for selection statements
- The Comparison Operators and the `boolean` Type
- One-way `if` Statements
- Two-way `if` Statement
  - Multiple Alternative if Statements
  - `if` … else matching
  - Common Errors
- Complex conditions with Logical Operators
  - Example: Determining Leap Year
  - The unconditional & and | Operators
- `switch` Statements
- The Conditional Operator
- Operator Precedence and Associativity
Computing the Area of a Circle:

```java
import java.util.Scanner;
public class ComputeArea {
    public static void main(String[] args) {
        Scanner input = new Scanner(System.in);
        System.out.print("Enter a radius: ");
        double radius = input.nextDouble();
        double area = radius * radius * 3.14159;
        // Display results
        System.out.println("The area for the circle" + " of radius " + radius + " is " + area);
    }
}
```

What if the user enters a negative value (i.e., an invalid value)?

The area for a circle with a negative radius does not make sense.
Motivation

If the user entered a negative value for radius in ComputeArea.java, then you don't want the program to compute the area, but to inform the user that their input was incorrect.
Computing the Area of a Circle:

```java
import java.util.Scanner;
public class ComputeAreaNew {
    public static void main(String[] args) {
        Scanner input = new Scanner(System.in);
        System.out.print("Enter a radius: ");
        double radius = input.nextDouble();
        if(radius >= 0){
            double area = radius * radius * 3.14159;
            System.out.println("The area for the circle" + " of radius "+ radius + " is "+ area);
        } else {
            System.out.println("The radius is negative." + " The area cannot be computed.");
        }
    }
}
```
The Comparison Operators and boolean Type

• Often in a programs you need to compare values:
  e.g., if \( x \) is greater than \( y \) then ...

• Java provides six comparison operators (also called relational operators) to compare two values: \(<\), \(\leq\), \(>\), \(\geq\), \(==\) and \(!=\)

• The result of the comparison is a Boolean value: \(\text{true}\) or \(\text{false}\). For example,

  ```java
  boolean b = (1 > 2);
  b is false after the statement.
  ```
## Comparison Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;</code></td>
<td>less than</td>
</tr>
<tr>
<td><code>&lt;=</code></td>
<td>less than or equal to</td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td>greater than</td>
</tr>
<tr>
<td><code>&gt;=</code></td>
<td>greater than or equal to</td>
</tr>
<tr>
<td><code>==</code></td>
<td>equal to</td>
</tr>
<tr>
<td><code>!=</code></td>
<td>not equal to</td>
</tr>
</tbody>
</table>
One-way `if` Statements

```java
if (boolean-expression) {
    statement(s);
}
```

```java
if (radius >= 0) {
    area = radius * radius * PI;
    System.out.println("The area for the circle of radius " + radius + " is " + area);
}
```

(A)

false

true

Statement(s)

(B)

false

true

area = radius * radius * PI;
System.out.println("The area for the circle of " + "radius " + radius + " is " + area);

One-way `if` Statements

**Condition containment is necessary!**

(a) Wrong

```java
if i > 0 {
    System.out.println("i is positive");
}
```

(b) Correct

```java
if (i > 0) {
    System.out.println("i is positive");
}
```

**Block containment is not necessary for a `single` statement!**

(a) Equivalent

```java
if (i > 0) {
    System.out.println("i is positive");
}
```

(b) Equivalent

```java
if (i > 0)
    System.out.println("i is positive");
```
Two-way if Statement

```java
if (boolean-expression) {
    statement(s) - for-the-true-case;
} else {
    statement(s) - for-the-false-case;
}
```

![Diagram of a two-way if statement]
Two-way if Example

```java
if (radius >= 0) {
    double area = radius * radius * 3.1415;
    System.out.println("The area for the" + " circle of radius " + radius + " is " + area);
} else
    System.out.println("Negative input");
```
Multiple Alternative if Statements

Indentation in Java is not required, but a good programming style.

```java
if (score >= 90.0)
    grade = 'A';
else
    if (score >= 80.0)
        grade = 'B';
    else
        if (score >= 70.0)
            grade = 'C';
        else
            if (score >= 60.0)
                grade = 'D';
            else
                grade = 'F';
```

**Indentation exception** for cascading if-else-if statements:

```java
if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';
```
if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';
Trace if-else statement

Suppose score is 70.0

if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';

The condition is false
Suppose score is 70.0

if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';

The condition is true.
Suppose score is 70.0

if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';

grade is C
Suppose score is 70.0

if (score >= 90.0)
    grade = 'A';
else if (score >= 80.0)
    grade = 'B';
else if (score >= 70.0)
    grade = 'C';
else if (score >= 60.0)
    grade = 'D';
else
    grade = 'F';

Exit the if statement
Inconsistent indentation can get us confused, so the rule is that the `else` clause matches the most recent `if` clause in the same block.

```
int i = 1;
int j = 2;
int k = 3;

if (i > j)
  if (i > k)
    System.out.println("A");
else
  System.out.println("B");
```

Wrong indentation

```
int i = 1;
int j = 2;
int k = 3;

if (i > j)
  if (i > k)
    System.out.println("A");
else
    ...
int k = 3;

if (i > j)
  if (i > k)
    System.out.println("A");
  else
    System.out.println("B");
```

Correct indentation

This does not print anything!
To force the else clause to match the first if clause, you must add a pair of braces:

```java
int i = 1;
int j = 2;
int k = 3;
if (i > j) {
    if (i > k)
        System.out.println("A");
} else
    System.out.println("B");
```

This code prints B.
Common Error

- Adding a semicolon at the end of an if clause is a common mistake (often occurs when you use the next-line block style):

```java
if (radius >= 0); \[Wrong\]
{
    area = radius*radius*PI;
    System.out.println("The area for the circle of radius " + radius + " is " + area);
}
```

- It is not a compilation error and it is not a runtime error
- It is a logic error because ";;" is a statement (the no-operation/no-op statement)
What’s wrong here?

```java
System.out.print("Enter your total cholesterol level: ");
int totalCholesterol = input.nextInt();

if (totalCholesterol >= 200)
    System.out.println("Your cholesterol is too high.");
    System.out.println("You need to lower that.");
else
    System.out.println("Good, eat away!");
```
What’s wrong here?

System.out.print("Enter your total cholesterol level: ");
int totalCholesterol = input.nextInt();

if (totalCholesterol >= 200)
    System.out.println("Your cholesterol is too high.");
    System.out.println("You need to lower that.");
else // SYNTAX ERROR HERE: this else does not match any if
    System.out.println("Good, eat away!");
What’s wrong here?

System.out.print("Enter your total cholesterol level: ");
int totalCholesterol = input.nextInt();

if (totalCholesterol >= 200) {
    System.out.println("Your cholesterol is too high.");
    System.out.println("You need to lower that.");
} else
    System.out.println("Good, eat away!");
Why is this *worse*?

```java
System.out.print("Enter your total cholesterol level:");
int totalCholesterol = input.nextInt();

if (totalCholesterol >= 200)
    System.out.println("Your cholesterol is too high.");
    System.out.println("You need to lower that.");
```
System.out.print("Enter your total cholesterol level:");
int totalCholesterol= input.nextInt();

if (totalCholesterol>= 200)
    System.out.println("Your cholesterol is too high.");
System.out.println("You need to lower that.");

// NO SYNTAX ERROR
// NO RUNTIME ERROR

// It is a Bug/logical error because it says to lower
// the cholesterol even if it is fine.
System.out.print("Enter your total cholesterol level: ");
int totalCholesterol = input.nextInt();

if (totalCholesterol >= 200) { // correct
    System.out.println("Your cholesterol is too high.");
    System.out.println("You need to lower that.");
}
What about complex conditions?

- For example: Computing Taxes: an income tax is calculated based on the filing status and taxable income (so, we need multiple complex logical conditions)

- There are four filing statuses: single filers, married filing jointly, married filing separately, and head of household combined with earnings.

<table>
<thead>
<tr>
<th>Marginal Tax Rate</th>
<th>Single (0)</th>
<th>Married Filing Jointly or Qualified Widow(er) (1)</th>
<th>Married Filing Separately (2)</th>
<th>Head of Household (3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10%</td>
<td>$0 – $8,350</td>
<td>$0 – $16,700</td>
<td>$0 – $8,350</td>
<td>$0 – $11,950</td>
</tr>
<tr>
<td>15%</td>
<td>$8,351 – $33,950</td>
<td>$16,701 – $67,900</td>
<td>$8,351 – $33,950</td>
<td>$11,951 – $45,500</td>
</tr>
<tr>
<td>35%</td>
<td>$372,951+</td>
<td>$372,951+</td>
<td>$186,476+</td>
<td>$372,951+</td>
</tr>
</tbody>
</table>
## Logical Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>not</td>
</tr>
<tr>
<td>&amp; &amp;</td>
<td>and</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>^</td>
<td>exclusive or</td>
</tr>
</tbody>
</table>
### Truth Table for Operator !

<table>
<thead>
<tr>
<th>p</th>
<th>!p</th>
<th>Example (assume age = 24, gender = 'F')</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
<td>!(age &gt; 18) is false, because (age &gt; 18) is true.</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>!(gender != 'F') is true, because (grade != 'F') is false.</td>
</tr>
</tbody>
</table>
## Truth Table for Operator &&

<table>
<thead>
<tr>
<th>p1</th>
<th>p2</th>
<th>p1 &amp;&amp; p2</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>true</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>true</td>
<td>true</td>
<td>true</td>
</tr>
</tbody>
</table>

Example (assume age = 24, gender = 'F')

- 
  \[(\text{age} > 18) \&\& (\text{gender} == 'F')\] is true, because \((\text{age} > 18)\) and \((\text{gender} == 'F')\) are both true.

- 
  \[(\text{age} > 18) \&\& (\text{gender} != 'F')\] is false, because \((\text{gender} != 'F')\) is false.
# Truth Table for Operator $||$

<table>
<thead>
<tr>
<th>p1</th>
<th>p2</th>
<th>$p1 \lor p2$</th>
<th>Example (assume age = 24, gender = 'F')</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
<td>(age &gt; 34) $\lor$ (gender == 'F') is true, because (gender == 'F') is true.</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>true</td>
<td>false</td>
<td>true</td>
<td>(age &gt; 34) $\lor$ (gender == 'M') is false, because (age &gt; 34) and (gender == 'M') are both false.</td>
</tr>
<tr>
<td>true</td>
<td>true</td>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
# Truth Table for Operator \(^\wedge\)

<table>
<thead>
<tr>
<th>p1</th>
<th>p2</th>
<th>p1 (^\wedge) p2</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>true</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>true</td>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

Example (assume age = 24, gender = 'F')

\((age > 34) \wedge (gender == 'F')\) is true, because \((age > 34)\) is false but \((gender == 'F')\) is true.

\((age > 34) \wedge (gender == 'M')\) is false, because \((age > 34)\) and \((gender == 'M')\) are both false.

\[ p1 \wedge p2 = p1 \neq p2 \]
• What is the result?

```java
boolean result;
result = (5 <= 9); // true
result = !(5 <= 9); // false
result = (3.9 > 3.19); // true
result = ('a' == 'A'); // false
result = (5 <= 9 && 8 > 9); // false
result = (5 <= 9 || 8 > 9); // true
```
Logical Operators Examples

System.out.println("Is " + number + " divisible by 2 and 3? "+ ((number % 2 == 0) && (number % 3 == 0)));

System.out.println("Is " + number + " divisible by 2 or 3? "+ ((number % 2 == 0) || (number % 3 == 0)));

System.out.println("Is " + number + " divisible by 2 or 3, but not both? "+ ((number % 2 == 0) ^ (number % 3 == 0)));

(c) Pearson Education, Inc. & Paul Fodor (CS Stony Brook)
Consider a program that prompts the user to enter a year as an int value and checks if it is a leap year.

A year is a leap year if it is divisible by 4 but not by 100, or it is divisible by 400.

\[(\text{year} \mod 4 == 0 && \text{year} \mod 100 != 0)\]
\[||\text{year} \mod 400 == 0\]
Determining Leap Year

2000: leap?
(true && false) || true = false || true = true

1900: leap?
(true && false) || false = false || false = false

2026: leap?
(false && NA) || false = false || false = false

2020: leap? (true && true) || NA= true || NA= true
The unconditional & and | Operators

- false && p2 (it does not execute p2) = false
- && is called short-cut operator
  - if the first operand is false, the conjunction is immediately false (skips the evaluation of the second operand)
- sometimes is what we want, e.g.:
  ref!=null && ref.property==constant
The unconditional & and | Operators

- true | | p2 (it does not execute p2) = true
- | | is called short-cut operator
  - if the first operand is true, the disjunction is immediately true (skips the evaluation of the second operand)
The unconditional & and | Operators

If x is 1, what is x after these expressions?

\[(x > 1) \&\& (x++ < 10)\]

false and \(NA = false\)

\[(x > 1) \& (x++ < 10)\]

2

\[(1 == x) \mid\mid (10 > x++)?\]

true or \(NA = true\)

\[(1 == x) \mid (10 > x++)?\]

2
switch (var) {
    case 0:
        ...;
        break;
    case 1:
        ...;
        break;
    case 2:
        ...;
        break;
    case 3:
        ...;
        break;
    default:
        ...;
}
switch Statements

Good for menus:

Enter an option:
A = burger
B = fries
C = exit

switch(option){
case 'A': System.out.println("burger");
break;
case 'B': System.out.println("fries");
break;
case 'C': System.out.println("exit"); break;
}
switch Statement Flow Chart

var is 0

break

var is 1

var is 3

break

default

Next Statement
switch Statement Rules

`char, byte, short, int, String`

- **value1**, ..., and **valueN** are **constant expressions** of the same data type as the value of the `switch`-expression
- **constant** = they cannot contain variables in the expression, such as `x+y`
**switch Statement Rules**

**break** is optional, but it terminates the remainder of the **switch** statement.

**default** is optional - executed when none of the specified cases matches the **switch**-expression.

```java
switch (switch-expression) {
    case value1:    statement(s)1;
                    break;
    case value2:    statement(s)2;
                    break;
    ...
    case valueN:    statement(s)N;
                    break;
    default:        statement(s);
}
```

execution in sequential order
Suppose ch is 'a':

```java
switch (ch) {
    case 'a':
        System.out.println(ch);
        break;

```java
switch (ch) {
    case 'a':    System.out.println(ch);
    case 'b':    System.out.println(ch);
    case 'c':    System.out.println(ch);
}
```

Execute this line
Trace switch statement 4

```java
switch (ch) {
    case 'a':    System.out.println(ch);
    case 'b':    System.out.println(ch);
    case 'c':    System.out.println(ch);
}
```

`C`
Conditional Operator

\[
\begin{align*}
\text{if } (x > 0) \\
y &= 1; \quad \text{else} \\
y &= -1;
\end{align*}
\]

is equivalent to

\[
y = (x > 0) \ ? \ 1 : \ -1;
\]

- Conditional Operator expression form:
  \[(\text{boolean-expression}) \ ? \ \text{expression1} : \ \text{expression2}\]
Conditional Operator

```
System.out.println(
    (num % 2 == 0)? num + " is even":num + " is odd");

System.out.println( num +
    ((num % 2 == 0)? " is even": " is odd");
```
Operator Precedence

1. `var++`, `var--`
2. `+`, `-` (Unary plus and minus), `++var, --var`
3. `(type)` Casting
4. `!` (Not)
5. `*, /, %` (Multiplication, division, and remainder)
6. `+`, `-` (Binary addition and subtraction)
7. `<`, `<=, >, >=` (Comparison)
8. `==, !=, ;` (Equality)
9. `^` (Exclusive OR)
10. `&&` (Conditional AND) Short-circuit AND
11. `||` (Conditional OR) Short-circuit OR
12. `=, +=, -=, *=, /=, %=` (Assignment operator)
Example

Applying the operator precedence and associativity rule, the expression $3 + 4 \times 4 > 5 \times (4 + 3) - 1$ is evaluated as follows:

1. Inside parentheses first
2. Multiplication
3. Multiplication
4. Addition
5. Subtraction
6. Greater than

$3 + 4 \times 4 > 5 \times (4 + 3) - 1$

$3 + 4 \times 4 > 5 \times 7 - 1$

$3 + 16 > 5 \times 7 - 1$

$3 + 16 > 35 - 1$

$19 > 35 - 1$

$19 > 34$

false
Operator Associativity

All binary operators except assignment operators are *left-associative*.

Example:

\[ 10 - 5 - 4 = (10 - 5) - 4 = 5 - 4 = 1 \]

The assignment operators are *right-associative*.

Example:

\[ a = b += c = 5; \]

is equivalent to \[ a = (b += (c = 5)) \];
System.out.print("Input change amount (1-99)");
originalAmount= scanner.readInt();
if (originalAmount< 1 || originalAmount> 99)
    System.out.println("ERROR: Out of range.");
else{
    numQuarters= originalAmount/ 25;
    remainder = originalAmount% 25;
    numDimes= remainder / 10;
    remainder = remainder % 10;
    numNickels= remainder / 5;
    remainder = remainder % 5;
    if (numQuarters!= 0) // Do not print if zero
        System.out.println(numQuarters+ " quarters");
    if (numDimes!= 0)// Do not print if zero
        System.out.println(numDimes+ " dimes");
    if (numNickels!= 0)// Do not print if zero
        System.out.println(numNickels+ " nickels");
    if (numPennies!= 0)// Do not print if zero
        System.out.println(numPennies+ " pennies");
}
• Nested ifs:

```java
if (numQuarters!= 0){ // Do not print if zero
    System.out.print(numQuarters+ " quarter");
    if (numQuarters== 1) // Do not print s if one
        System.out.println( );
    else
        System.out.println("s"); // print s if more
}
```
