# Discrete Mathematics (Proof Techniques) 

Pramod Ganapathi<br>Department of Computer Science<br>State University of New York at Stony Brook

March 21, 2022

## What is a proof?

## Definition

- A proof is a method for establishing the truth of a statement.

| Rigor | Truth type | Field | Truth teller |
| :---: | :--- | :--- | :--- |
| 0 | Word of God | Religion | God/Priests |
| 1 | Authoritative truth | Business/School | Boss/Teacher |
| 2 | Legal truth | Judiciary | Law/Judge/Law makers |
| 3 | Philosophical truth | Philosophy | Plausible argument |
| 4 | Scientific truth | Physical sciences | Experiments/Observations |
| 5 | Statistical truth | Statistics | Data sampling |
| 6 | Mathematical truth | Mathematics | Logical deduction |

## What is a mathematical proof?

Definition

- A mathematical proof is a verification for establishing the truth of a proposition by a chain of logical deductions from a set of axioms

Concepts

1. Proposition

Covered in sufficient depth in logic
2. Axiom

An axiom is a proposition that is assumed to be true Example: For mathematical quantities $a$ and $b$, if $a=b$, then
$b=a$
3. Logical deduction

We call this process - the axiomatic method
We will cover several proof techniques in this chapter

## Why care for mathematical proofs?

- The current world ceases to function without math proofs
- (My belief) Reduction tree showing subjects that possibly could be expressed or understood in terms of other subjects

## Methods of mathematical proof

| Statements | Method of proof |
| :--- | :--- |
| Proving existential statements | Constructive proof |
| (Disproving universal statements) | Non-constructive proof |
| Proving universal statements | Direct proof |
| (Disproving existential statements) | Proof by mathematical induction |
|  | Well-ordering principle |
|  | Proof by exhaustion |
|  | Proof by cases |
|  | Proof by contradiction |
|  | Proof by contraposition |
|  | Computer-aided proofs |

## Introduction to number theory

## Definition

- Number theory is the branch of mathematics that deals with the study of integers

| Numbers | Set |
| :--- | :--- |
| Natural numbers $(\mathbb{N})$ | $\{1,2,3, \ldots\}$ |
| Whole numbers $(\mathbb{W})$ | $\{0,1,2, \ldots\}$ |
| Integers $(\mathbb{Z})$ | $\{0, \pm 1, \pm 2, \pm 3, \ldots\}$ |
| Even numbers $(\mathbb{E})$ | $\{0, \pm 2, \pm 4, \pm 6, \ldots\}$ |
| Odd numbers $(\mathbb{D})$ | $\{ \pm 1, \pm 3, \pm 5, \pm 7, \ldots\}$ |
| Prime numbers $(\mathbb{P})$ | $\{2,3,5,7,11, \ldots\}$ |
| Composite numbers $(\mathbb{C})$ | $\{$ Natural numbers $(>1)$ that are not prime $\}$ |
| Rational numbers $(\mathbb{Q})$ | $\{$ Ratio of integers with non-zero denominator $\}$ |
| Real numbers $(\mathbb{R})$ | $\{$ Numbers with infinite decimal representation $\}$ |
| lrrational numbers $(\mathbb{I})$ | \{Real numbers that are not rational $\}$ |
| Complex numbers $(\mathbb{S})$ | \{real $+i \cdot$ real $\}$ |

## Even and odd numbers

## Definitions

- An integer $n$ is even iff $n$ equals twice some integer; Formally, for any integer $n$,

$$
n \text { is even } \Leftrightarrow n=2 k \text { for some integer } k
$$

- An integer $n$ is odd iff $n$ equals twice some integer plus 1 ; Formally, for any integer $n$,

$$
n \text { is odd } \Leftrightarrow n=2 k+1 \text { for some integer } k
$$

## Examples

- Even numbers:
$0,2,4,6,8,10,12,14,16,18,20,22,24,26,28,30,32, \ldots$
- Odd numbers:
$1,3,5,7,9,11,13,15,17,19,21,23,25,27,29,31,33,35, \ldots$

## Rational and irrational numbers

## Definitions

- A real number $r$ is rational iff it can be expressed as a ratio of two integers with a nonzero denominator;
Formally, if $r$ is a real number, then
$r$ is rational $\Leftrightarrow \exists$ integers $a, b$ such that $r=\frac{a}{b}$ and $b \neq 0$
- A real number $r$ is irrational iff it is not rational

## Examples

- Rational numbers:
$10,-56.47,10 / 13,0,-17 / 9,0.121212 \ldots,-91, \ldots$
- Irrational numbers:
$\sqrt{2}, \sqrt{3}, \sqrt{2}^{\sqrt{2}}, \pi, \phi, e, \pi^{2}, e^{2}, 2^{1 / 3}, \log _{2} 3, \ldots$
- Open problems:

It's not known if $\pi+e, \pi e, \pi / e, \pi^{e}, \pi^{\sqrt{2}}$, and $\ln \pi$ are irrational

## Divisibility

## Definitions

- If $n$ and $d$ are integers, then $n$ is divisible by $d$, denoted by $d \mid n$, iff $n$ equals $d$ times some integer and $d \neq 0$;
Formally, if $n$ and $d$ are integers

$$
d \mid n \Leftrightarrow \exists \text { integer } k \text { such that } n=d k \text { and } d \neq 0
$$

- Instead of " $n$ is divisible by $d$," we can say:
$n$ is a multiple of $d$, or
$d$ is a factor of $n$, or
$d$ is a divisor of $n$, or
$d$ divides $n$ (denoted by $d \mid n$ )
- Note: $d \mid n$ is different from $d / n$

## Examples

- Divides: $1|1,10| 10,2|4,3| 24,7 \mid-14, \ldots$
- Does not divide: $2 \nmid 1,10 \nmid 1,10 \nmid 2,7 \nmid 10,10 \nmid 7,10 \nmid-7, \ldots$

## Quotient-Remainder theorem

## Theorem

- Given any integer $n$ and a positive integer $d$, there exists an integer $q$ and a whole number $r$ such that

$$
n=q d+r \text { and } r \in[0, d-1]
$$

## Examples

- Let $n=6$ and $d \in[1,7]$

| Num. $(n)$ | Divisor $(d)$ | Theorem | Quotient $(q)$ | Rem. $(r)$ |
| :---: | :---: | :---: | :---: | :---: |
| 6 | 1 | $6=6 \times 1+0$ | 6 | 0 |
| 6 | 2 | $6=3 \times 2+0$ | 3 | 0 |
| 6 | 3 | $6=2 \times 3+0$ | 2 | 0 |
| 6 | 4 | $6=1 \times 4+2$ | 1 | 2 |
| 6 | 5 | $6=1 \times 5+1$ | 1 | 1 |
| 6 | 6 | $6=1 \times 6+0$ | 1 | 0 |
| 6 | 7 | $6=0 \times 7+6$ | 0 | 6 |

## Prime numbers

| Num. | Factorization | Prime? |
| :---: | :--- | :---: |
| 2 | $2=1 \times 2=2 \times 1$ | $\checkmark$ |
| 3 | $3=1 \times 3=3 \times 1$ | $\checkmark$ |
| 4 | $4=1 \times 4=4 \times 1=2 \times 2$ | $\boldsymbol{x}$ |
| 5 | $5=1 \times 5=5 \times 1$ | $\checkmark$ |
| 6 | $6=1 \times 6=6 \times 1=2 \times 3=3 \times 2$ | $\mathbf{X}$ |
| 7 | $7=1 \times 7=7 \times 1$ | $\checkmark$ |
| 8 | $8=1 \times 8=8 \times 1=2 \times 4=4 \times 2$ | $\mathbf{x}$ |
| 9 | $9=1 \times 9=9 \times 1=3 \times 3$ | $\mathbf{x}$ |
| 10 | $10=1 \times 10=10 \times 1=2 \times 5=5 \times 2$ | $\mathbf{x}$ |
| 11 | $11=1 \times 11=11 \times 1$ | $\boldsymbol{\checkmark}$ |
| 12 | $12=1 \times 12=12 \times 1=2 \times 6=6 \times 2=3 \times 4=4 \times 3$ | $\mathbf{x}$ |
| 13 | $13=1 \times 13=13 \times 1$ | $\checkmark$ |
| 14 | $14=1 \times 14=14 \times 1=2 \times 7=7 \times 2$ | $\mathbf{x}$ |
| 15 | $15=1 \times 15=15 \times 1=3 \times 5=5 \times 3$ | $\mathbf{x}$ |
| 16 | $16=1 \times 16=16 \times 1=2 \times 8=8 \times 2=4 \times 4$ | $\mathbf{x}$ |
| 17 | $17=1 \times 17=17 \times 1$ | $\checkmark$ |

## Prime numbers

Definitions

- A natural number $n$ is prime iff $n>1$ and it has exactly two positive divisors: 1 and $n$
- A natural number $n$ is composite iff $n>1$ and it has at least three positive divisors, two of which are 1 and $n$
- A natural number $n$ is a perfect square iff it has an odd number of divisors
- A natural number $n$ is not a perfect square iff it has an even number of divisors

## Examples

- Perfect squares: $1,4,9,16,25, \ldots$
- Not perfect squares: $2,3,5,6,7,8,10, \ldots$

## Prime numbers

Definitions

- A natural number $n$ is prime iff $n>1$ and for all natural numbers $r$ and $s$, if $n=r s$, then either $r$ or $s$ equals $n$; Formally, for each natural number $n$ with $n>1$,

$$
\begin{aligned}
n \text { is prime } \Leftrightarrow & \forall \text { natural numbers } r \text { and } s \text {, if } n=r s \\
& \text { then } n=r \text { or } n=s
\end{aligned}
$$

- A natural number $n$ is composite iff $n>1$ and $n=r s$ for some natural numbers $r$ and $s$ with $1<r<n$ and $1<s<n$; Formally, for each natural number $n$ with $n>1$,
$n$ is composite $\Leftrightarrow \exists$ natural numbers $r$ and $s$, if $n=r s$ and $1<r<n$ and $1<s<n$

## Unique prime factorization of natural numbers

| $n$ | Unique prime <br> factorization |
| :---: | :--- |
| 2 | 2 |
| 3 | 3 |
| 4 | $2^{2}$ |
| 5 | 5 |
| 6 | $2 \times 3$ |
| 7 | 7 |
| 8 | $2^{3}$ |
| 9 | $3^{2}$ |
| 10 | $2 \times 5$ |
| 11 | 11 |
| 12 | $2^{2} \times 3$ |
| 13 | 13 |
| 14 | $2 \times 7$ |
| 15 | $3 \times 5$ |

| $n$ | Unique prime <br> factorization |
| :---: | :--- |
| 16 | $2^{4}$ |
| 17 | 17 |
| 18 | $2 \times 3^{2}$ |
| 19 | 19 |
| 20 | $2^{2} \times 5$ |
| 21 | $3 \times 7$ |
| 22 | $2 \times 11$ |
| 23 | 23 |
| 24 | $2^{3} \times 3$ |
| 25 | $5^{2}$ |
| 26 | $2 \times 13$ |
| 27 | $3^{3}$ |
| 28 | $2^{2} \times 7$ |
| 29 | 29 |

| $n$ | Unique prime <br> factorization |
| :---: | :--- |
| 30 | $2 \times 3 \times 5$ |
| 31 | 31 |
| 32 | $2^{5}$ |
| 33 | $3 \times 11$ |
| 34 | $2 \times 17$ |
| 35 | $5 \times 7$ |
| 36 | $2^{2} \times 3^{2}$ |
| 37 | 37 |
| 38 | $2 \times 19$ |
| 39 | $3 \times 13$ |
| 40 | $2^{3} \times 5$ |
| 41 | 41 |
| 42 | $2 \times 3 \times 7$ |
| 43 | 43 |

- What is the pattern?

## Unique prime factorization of natural numbers

## Definition

- Any natural number $n>1$ can be uniquely represented as a product of as follows:

$$
n=p_{1}^{e_{1}} \times p_{2}^{e_{2}} \times \cdots \times p_{k}^{e_{k}}
$$

such that $p_{1}<p_{2}<\cdots<p_{k}$ are primes in [2, n], $e_{1}, e_{2}, \ldots, e_{k}$ are whole number exponents, and $k$ is a natural number.

- The theorem is also called fundamental theorem of arithmetic
- The form is called standard factored form

## Some terms

## Definitions

- Absolute value of real number $x$, denoted by $|x|$ is

$$
|x|= \begin{cases}x & \text { if } x \geq 0 \\ -x & \text { if } x<0\end{cases}
$$

- Triangle inequality. For all real numbers $x$ and $y$, $|x+y| \leq|x|+|y|$
- Floor of a real number $x$, denoted by $\lfloor x\rfloor$ is
$\lfloor x\rfloor=$ unique integer $n$ such that $n \leq x<n+1$
$\lfloor x\rfloor=n \Leftrightarrow n \leq x<n+1$
- Ceiling of a real number $x$, denoted by $\lceil x\rceil$ is
$\lceil x\rceil=$ unique integer $n$ such that $n-1<x \leq n$
$\lceil x\rceil=n \Leftrightarrow n-1<x \leq n$

## Some terms

## Definitions

- Given an integer $n$ and a natural number $d$, $n$ div $d=$ integer quotient obtained when $n$ is divided by $d$, $n$ mod $d=$ whole number remainder obtained when $n$ is divided by $d$.
- Symbolically,
$n$ div $d=q$ and $n \bmod d=r \Leftrightarrow n=d q+r$ where $q$ and $r$ are integers and $0 \leq r<d$.

## Properties of a proof

## Properties

- Concise
- Clear
- Complete
- Logical
- Rigorous
- Convincing
(not unnecessarily long)
(not ambiguous)
(no missing intermediate steps)
(every statement logically follows)
(uses mathematical expressions) (does not raise questions)
- The way a proof is presented might be different from the way the proof is discovered.

Direct Proof

## Even + odd $=$ odd

Proposition

- Sum of an even integer and an odd integer is odd.

## Even + odd $=$ odd

## Proposition

- Sum of an even integer and an odd integer is odd.

## Proof

- Suppose $a$ is even and $b$ is odd. Then

$$
\begin{array}{lr}
a+b & \\
=(2 m)+b & \text { (defn. of even, } a=2 m \text { for integer } m) \\
=(2 m)+(2 n+1) & \text { (defn. of odd, } b=2 n+1 \text { for integer } n) \\
=2(m+n)+1 & \text { (taking } 2 \text { as common factor) } \\
=2 p+1 & (p=m+n \text { and addition is closed on integers) } \\
=\text { odd } & \text { (defn. of odd) }
\end{array}
$$

## Problems for practice

Prove the following propositions:

- Even + even $=$ even
- Even + odd = odd
- Odd + odd $=$ even
- Even $\times$ integer $=$ even
- Odd $\times$ odd $=$ odd

Proposition

- The square of an odd integer is odd.

## Proposition

- The square of an odd integer is odd.

## Proof

- Prove: If $n$ is odd, then $n^{2}$ is odd.
$n$ is odd
$\Longrightarrow n=(2 k+1) \quad$ (defn. of odd, $k$ is an integer)
$\Longrightarrow n^{2}=(2 k+1)^{2}$
$\Longrightarrow n^{2}=4 k^{2}+4 k+1$
(squaring on both sides)
(expanding the binomial)
$\Longrightarrow n^{2}=2\left(2 k^{2}+2 k\right)+1 \quad$ (factoring 2 from first two terms)
$\Longrightarrow n^{2}=2 j+1$
(let $j=2 k^{2}+2 k$ )
( $j$ is an integer as mult. and add. are closed on integers)
$\Longrightarrow n^{2}$ is odd (defn. of odd)

## Odd $=$ difference of squares

Proposition

- Every odd integer is equal to the difference between the squares of two integers

## Odd $=$ difference of squares

## Proposition

- Every odd integer is equal to the difference between the squares of two integers

## Workout

- Write a formal statement.
$\forall$ integer $k, \exists$ integers $m, n$ such that
$(2 k+1)=m^{2}-n^{2}$.
- Try out a few examples.

$$
\begin{array}{ll}
1=1^{2}-0^{2} & -1=0^{2}-(-1)^{2} \\
3=2^{2}-1^{2} & -3=(-1)^{2}-(-2)^{2} \\
5=3^{2}-2^{2} & -5=(-2)^{2}-(-3)^{2} \\
7=4^{2}-3^{2} & -7=(-3)^{2}-(-4)^{2}
\end{array}
$$

- Find a pattern.
$(k+1)^{2}-k^{2}=\left(k^{2}+2 k+1\right)-k^{2}=2 k+1=$ odd

## Odd $=$ difference of squares

## Proposition

- Every odd integer is equal to the difference between the squares of two integers.

Proof

- Any odd integer can be written as $(2 k+1)$ for some integer $k$.
- We rewrite the expression as follows.
$2 k+1$
$=\left(k^{2}+2 k+1\right)-k^{2} \quad$ (adding and subtracting $\left.k^{2}\right)$
$=(k+1)^{2}-k^{2}$
(write the first term as sum)
$=m^{2}-n^{2} \quad($ set $m=k+1$ and $n=k)$
The term $m$ is an integer as addition is closed on integers.
- So, every odd integer can be written as the difference between two squares.

## Odd $=$ difference of squares

$$
k^{2} \text { cells }
$$

$(k+1)^{2}$ cells

## If $a \mid b$ and $b \mid c$, then $a \mid c$

## Proposition

- (Transitivity) For integers $a, b, c$, if $a \mid b$ and $b \mid c$, then $a \mid c$.

## If $a \mid b$ and $b \mid c$, then $a \mid c$

## Proposition

- (Transitivity) For integers $a, b, c$, if $a \mid b$ and $b \mid c$, then $a \mid c$.

Proof

- Formal statement.
$\forall$ integers $a, b, c$, if $a \mid b$ and $b \mid c$, then $a \mid c$.
- $c$
$=b n$
$=(a m) n$
$=a(m n)$
$=a k \quad$ (let $k=m n$ and multiplication is closed on integers)
$\Longrightarrow a \mid c$
( $b \mid c$ and definition of divisibility) ( $a \mid b$ and definition of divisibility)
(multiplication is associative)
(definition of divisibility and $k$ is an integer)

## Summation

> Proposition
> • $1+2+3+\cdots+n=n(n+1) / 2$

## Summation

## Proposition

- $1+2+3+\cdots+n=n(n+1) / 2$.

## Proof

- Formal statement. $\forall$ natural number $n$, prove that $1+2+3+\cdots+n=n(n+1) / 2$.
- $S=1+2+3+\cdots+n$
$\Longrightarrow S=n+(n-1)+(n-2)+\cdots+1$
(addition on integers is commutative)
$\Longrightarrow 2 S=\underbrace{(n+1)+(n+1)+(n+1)+\cdots+(n+1)}_{n \text { terms }}$
(adding the previous two equations)
(simplifying)
$\Longrightarrow 2 S=n(n+1)$
$\Longrightarrow S=n(n+1) / 2$
(divide both sides by 2 )

Proof by Negation

Proposition

- $2^{999}+1$ is prime.

## Proposition

- $2^{999}+1$ is prime.

## Workout

- Trying out a few examples is not possible here.
- When is a number prime?

A number that is not composite is prime.

- When is a number composite?

A number is composite if we can factorize it.

- How do you check if a number can be factorized?

Check whether the number satisfies an algebraic formula that can be factored.
It seems like the given number can be represented as $a^{3}+b^{3}$.

## Proposition

- $2^{999}+1$ is prime.

## Solution

- False! $2^{999}+1$ is composite.
- $2^{999}+1$
$=\left(2^{333}\right)^{3}+1^{3}$
$=a^{3}+b^{3}$
$=(a+b)\left(a^{2}-a b+b^{2}\right)$
$=\left(2^{333}+1\right)\left(2^{666}-2^{333}+1\right)$
$=$ composite
(terms represented as cubes) (set $a=2^{333}, b=1$ ) (factorize $a^{3}+b^{3}$ )
(substituting $a$ and $b$ values)

Proposition

- There is a natural number $n$ such that $n^{2}+3 n+2$ is prime.

## Proposition

- There is a natural number $n$ such that $n^{2}+3 n+2$ is prime.

## Workout

- Write a formal statement.
$\exists$ natural number $n$ such that $n^{2}+3 n+2$ is prime.
- Try out a few examples.

$$
\begin{array}{ll}
1^{2}+3(1)+2=6 & \text { composite } \\
2^{2}+3(2)+2=12 & \text { composite } \\
3^{2}+3(3)+2=20 & \text { composite } \\
4^{2}+3(4)+2=30 & \text { composite } \\
5^{2}+3(5)+2=42 & \\
\text { composite }
\end{array}
$$

- Find a pattern.

It seems like $n^{2}+3 n+2$ is always composite.

## Proposition

- There is a natural number $n$ such that $n^{2}+3 n+2$ is prime.

## Solution

- False!
- Proving that the given statement is false is equivalent to proving that its negation is true.
Negation. $\forall$ natural number $n, n^{2}+3 n+2$ is composite.
- $n^{2}+3 n+2$
$=n^{2}+n+2 n+2$
$=n(n+1)+2(n+1)$
$=(n+1)(n+2)$
(split $3 n$ )
(taking common factors) (distributive law)
= composite
$(n+1>1$ and $n+2>1)$

## Polynomial root

Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

## Polynomial root

## Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

Proof

- Substitute $x=7$ in the expression to get $7^{3}-7\left(7^{2}\right)+7-7=0$. As $x$ satisfies the equation, $x=7$.

## Polynomial root

## Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

Proof

- Substitute $x=7$ in the expression to get $7^{3}-7\left(7^{2}\right)+7-7=0$. As $x$ satisfies the equation, $x=7$.
- Incorrect! What's wrong?

## Polynomial root

Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

## Polynomial root

## Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

## Proof

- False!
- A polynomial equation of degree $n$ has $n$ roots.

So, the polynomial equation $x^{3}-7 x^{2}+x-7=0$ has 3 roots.

- We factorize the expression.
$x^{3}-7 x^{2}+x-7$
$=x^{2}(x-7)+(x-7)$ (taking $x^{2}$ factor from first two terms)
$=(x-7)\left(x^{2}+1\right) \quad$ (taking $(x-7)$ factor)
$=(x-7)(x+i)(x-i) \quad$ (factorizing $\left.\left(x^{2}+1\right)\right)$
(this is because $\left.(x+i)(x-i)=\left(x^{2}-i^{2}\right)=\left(x^{2}+1\right)\right)$
So, the three roots to the equation $x^{3}-7 x^{2}+x-7=0$ are $x=7, x=-\sqrt{-1}$, and $x=\sqrt{-1}$.

## Polynomial root

## Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

Proof (continued)

- Exactly one of the three roots is $x=7$. Hence, we have

$$
\begin{aligned}
& x=7 \Longrightarrow x^{3}-7 x^{2}+x-7=0 \\
& x^{3}-7 x^{2}+x-7=0 \nRightarrow x=7
\end{aligned}
$$

## Polynomial root

Proposition

- If $x$ is a real number and $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

## Polynomial root

## Proposition

- If $x$ is a real number and $x^{3}-7 x^{2}+x-7=0$, then $x=7$.

## Proof

- We factorize the expression.
$x^{3}-7 x^{2}+x-7$
$=x^{2}(x-7)+(x-7)$ (taking $x^{2}$ factor from first two terms)
$=(x-7)\left(x^{2}+1\right)$ (taking $(x-7)$ factor)
$=(x-7)(x+i)(x-i) \quad$ (factorizing $\left.\left(x^{2}+1\right)\right)$
(this is because $\left.(x+i)(x-i)=\left(x^{2}-i^{2}\right)=\left(x^{2}+1\right)\right)$
So, the three roots to the equation $x^{3}-7 x^{2}+x-7=0$ are $x=7, x=-\sqrt{-1}$, and $x=\sqrt{-1}$.
As $x$ has to be a real number, $x=7$.

## Proof by Counterexample

## Proposition

- For all real numbers $a$ and $b$, if $a^{2}=b^{2}$, then $a=b$.

## Proposition

- For all real numbers $a$ and $b$, if $a^{2}=b^{2}$, then $a=b$.

## Solution

- False! Counterexample: $a=1$ and $b=-1$. In this example, $a^{2}=b^{2}$ but $a \neq b$.

## Proposition

- For all real numbers $a$ and $b$, if $a^{2}=b^{2}$, then $a=b$.

## Solution

- False! Counterexample: $a=1$ and $b=-1$. In this example, $a^{2}=b^{2}$ but $a \neq b$.

## Proposition

- For all nonzero integers $a$ and $b$, if $a \mid b$ and $b \mid a$, then $a=b$.

## Proposition

- For all real numbers $a$ and $b$, if $a^{2}=b^{2}$, then $a=b$.

## Solution

- False! Counterexample: $a=1$ and $b=-1$. In this example, $a^{2}=b^{2}$ but $a \neq b$.

## Proposition

- For all nonzero integers $a$ and $b$, if $a \mid b$ and $b \mid a$, then $a=b$.

## Solution

- False! Counterexample: $a=1$ and $b=-1$.

In this example, $a \mid b$ and $b \mid a$, however, $a \neq b$.

## $2^{n}+1$

## Proposition

- $2^{n}+1$ is prime for any natural number $n$.

## Proposition

- $2^{n}+1$ is prime for any natural number $n$.

Workout

- Write a formal statement.
$\forall$ natural number $n, 2^{n}+1$ is prime.
- Try out a few examples.

$$
\begin{array}{ll}
2^{1}+1=3 & \\
2^{2}+1=5 & \\
2^{3}+1=9=3^{2} & \\
\text { prime } \\
\text { composite }
\end{array}
$$

- Find a pattern.
$2^{n}+1$ can be either prime or composite.

## Proposition

- $2^{n}+1$ is prime for any natural number $n$.

## Workout

- Write a formal statement.
$\forall$ natural number $n, 2^{n}+1$ is prime.
- Try out a few examples.

$$
\begin{array}{ll}
2^{1}+1=3 & \\
2^{2}+1=5 & \\
\text { prime } \\
2^{3}+1=9=3^{2} & \\
\text { prime } \\
\text { composite }
\end{array}
$$

- Find a pattern.
$2^{n}+1$ can be either prime or composite.

## Solution

- False! Counterexample: $n=3$

When $n=3$, then $2^{n}+1=2^{3}+1=9=3^{2}$ is composite.

## Proposition

- $n^{2}+n+41$ is prime for any whole number $n$.

## Proposition

- $n^{2}+n+41$ is prime for any whole number $n$.

Workout

- Write a formal statement.
$\forall$ whole number $n, n^{2}+n+41$ is prime.
- Try out a few examples.

$$
\begin{array}{ll}
0^{2}+0+41=41 & \\
1^{2}+1+41=43 & \text { prime } \\
2^{2}+2+41=47 & \\
3^{2}+3+41=53 & \text { prime } \\
4^{2}+4+41=61 & \text { prime } \\
5^{2}+5+41=71 & \\
\text { prime } \\
\text { prime }
\end{array}
$$

- Find a pattern.

It seems like $n^{2}+n+41$ is always prime.

Proposition

- $n^{2}+n+41$ is prime for any whole number $n$.

## Proposition

- $n^{2}+n+41$ is prime for any whole number $n$.

## Solution

- False!
- Formal statement. $\forall$ whole numbers $n, n^{2}+n+41$ is prime.
- Counterexample: 41. $\left(41^{2}+41+41=41(41+1+1)=41 \times 43\right)$
- Another counterexample: 40.
$\left(40^{2}+40+41=40(40+1)+41=40 \times 41+41=41(40+1)=\right.$ $41 \times 41$ )

$$
x /(y+z)+y /(x+z)+z /(x+y)
$$

## Proposition

- $\frac{x}{y+z}+\frac{y}{x+z}+\frac{z}{x+y}=4$ has no positive integer solutions.

$$
x /(y+z)+y /(x+z)+z /(x+y)
$$

## Proposition

- $\frac{x}{y+z}+\frac{y}{x+z}+\frac{z}{x+y}=4$ has no positive integer solutions.

## Workout

- Write a formal statement.
$\forall x, y, z \in \mathbb{N}, x /(y+z)+y /(x+z)+z /(x+y) \neq 4$.
- Try out a few examples.

$$
\begin{array}{ll}
(x, y, z) & x /(y+z)+y /(x+z)+z /(x+y)=4 ? \\
(1,1,1) & 1 / 2+1 / 2+1 / 2=1.5 \neq 4 \\
(1,2,1) & 1 / 3+2 / 2+1 / 3=1.666 \cdots \neq 4 \\
(1,2,3) & 1 / 5+2 / 4+3 / 3=1.7 \neq 4 \\
(1,10,100) & 1 / 110+10 / 101+100 / 11=9.199 \cdots \neq 4
\end{array}
$$

- Find a pattern.

It seems like there are no +ve integers satisfying the property.

$$
x /(y+z)+y /(x+z)+z /(x+y)
$$

## Proposition

- $\frac{x}{y+z}+\frac{y}{x+z}+\frac{z}{x+y}=4$ has no positive integer solutions.

## Solution

- False!
- Counterexample:
$x=15447680210874616644195131501991983748566432566$ 9565431700026634898253202035277999
$y=36875131794129999827197811565225474825492979968$ 971970996283137471637224634055579

## 121111111111111111111111111111111111111111

Proposition

- For whole numbers $n, 12 \underbrace{11 \cdots 1}_{n \text { terms }}$ is composite.

## 121111111111111111111111111111111111111111

## Proposition

- For whole numbers $n, 12 \underbrace{11 \cdots 1}_{n \text { terms }}$ is composite.

## Workout

- Try out a few examples.

| $(n$, Number $)$ | Factorization |
| :--- | :--- |
| $(0,12)$ | $3 \times 4$ |
| $(1,121)$ | $11 \times 11$ |
| $(2,1211)$ | $7 \times 173$ |
| $(3,12111)$ | $33 \times 367$ |
| $(4,121111)$ | $281 \times 431$ |
| $(5,1211111)$ | $253 \times 4787$ |

- Find a pattern.

It seems like the sequence of numbers is composite.

## 121111111111111111111111111111111111111111

## Proposition

- For whole numbers $n \geq 0,12 \underbrace{11 \cdots 1}_{n \text { terms }}$ is composite.

Solution

- False!
- Smallest counterexample: $n=136$.

$$
\begin{aligned}
& 12,1111111111,1111111111,11111111111,1111111111, \\
& 1111111111,1111111111,1111111111,1111111111, \\
& 1111111111,1111111111,1111111111,1111111111, \\
& 1111111111,111111 \text { is prime. }
\end{aligned}
$$

Proof by Contraposition

## Proposition

- If $n^{2}$ is odd, then $n$ is odd.

## Proposition

- If $n^{2}$ is odd, then $n$ is odd.

## Proof

- Seems very difficult to prove directly.

Contraposition: If $n$ is even, then $n^{2}$ is even.
$n$ is even
$\Longrightarrow n=2 k$
$\Longrightarrow n^{2}=(2 k)^{2}$
$\Longrightarrow n^{2}=4 k^{2}$
$\Longrightarrow n^{2}=2\left(2 k^{2}\right)$
(defn. of even, $k$ is an integer) (squaring on both sides) (simplifying) (factoring 2)
$\Longrightarrow n^{2}=2 j$ (let $j=2 k^{2}$ )
( $j$ is an integer as mult. is closed on integers)
$\Longrightarrow n^{2}$ is even (defn. of even)

Proposition

- The square of an integer is odd if and only if the integer itself is odd.

## Proposition

- The square of an integer is odd if and only if the integer itself is odd.

## Workout

- Write a formal statement.
$\forall$ integer $n, n^{2}$ is odd $\Leftrightarrow n$ is odd.
- Try out a few examples.

| Odd numbers | Even numbers |
| :--- | :--- |
| $(1,1)$ | $(0,0)$ |
| $(3,9)$ | $(2,4)$ |
| $(5,25)$ | $(4,16)$ |
| $(7,49)$ | $(6,36)$ |

- Pattern. It seems that the proposition is true.

Proposition

- The square of an integer is odd if and only if the integer itself is odd.

Proof
There are two parts in the proof.

1. Prove that if $n$ is odd, then $n^{2}$ is odd.

Direct proof
2. Prove that if $n^{2}$ is odd, then $n$ is odd.

Proof by contraposition

Corollary

- Prove that the fourth power of an integer is odd if and only if the integer itself is odd.

Corollary

- Prove that the fourth power of an integer is odd if and only if the integer itself is odd.

Proof

- We have
$n$ is odd $\Leftrightarrow n^{2}$ is odd
$\Longrightarrow n^{2}$ is odd $\Leftrightarrow n^{4}$ is odd
$\Longrightarrow n$ is odd $\Leftrightarrow n^{4}$ is odd
(previous theorem)
(previous theorem used on $n^{2}$ )
(transitivity of biconditional)

## Corollary

- Prove that the fourth power of an integer is odd if and only if the integer itself is odd.

Proof

- We have
$n$ is odd $\Leftrightarrow n^{2}$ is odd $\quad$ (previous theorem)
$\Longrightarrow n^{2}$ is odd $\Leftrightarrow n^{4}$ is odd (previous theorem used on $n^{2}$ )
$\Longrightarrow n$ is odd $\Leftrightarrow n^{4}$ is odd (transitivity of biconditional)

## Problem

- Suppose $k$ is a whole number. Prove that an integer $n$ is odd if and only if $n^{2^{k}}$ is odd.

Proposition

- For all integers $n$, if $n^{2}$ is even, then $n$ is even.

## Proposition

- For all integers $n$, if $n^{2}$ is even, then $n$ is even.

## Proof

- Contrapositive. For all integers, if $n$ is odd, then $n^{2}$ is odd.
- $n=2 k+1$
$\Longrightarrow n^{2}=(2 k+1)^{2}$
$\Longrightarrow n^{2}=4 k^{2}+4 k+1$
$\Longrightarrow n^{2}=2\left(2 k^{2}+2 k\right)+1$
$\Longrightarrow n^{2}=2 m+1$
( $m$ is an integer as multiplication is closed on integers)
$\Longrightarrow n^{2}=$ odd
(definition of odd number)
- Hence, the proposition is true.
(taking 2 out from two terms)
(set $m=2 k^{2}+2 k$ )
(squaring both sides)
(expand)
(definition of odd number)
$\square$

## Polynomial root

Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x \neq 10$.

## Polynomial root

## Proposition

- If $x^{3}-7 x^{2}+x-7=0$, then $x \neq 10$.

## Proof

- Contrapositive. If $x=10$, then $x^{3}-7 x^{2}+x-7 \neq 0$

Substitute $x=10$ in the expression.
We get $10^{3}-7\left(10^{2}\right)+10-7=1000-700+10-7=303 \neq 0$. That is, $x=10$ does not satisfy $x^{3}-7 x^{2}+x-7=0$ equation. Hence, the contraposition is correct which implies that the original statement is correct.

## Proposition

- Let $a, b, n \in \mathbb{Z}$. If $n \nmid a b$, then $n \nmid a$ and $n \nmid b$.

## Proposition

- Let $a, b, n \in \mathbb{Z}$. If $n \nmid a b$, then $n \nmid a$ and $n \nmid b$.

## Proof

- Contrapositive. Let $a, b, n \in \mathbb{Z}$. If $n \mid a$ or $n \mid b$, then $n \mid a b$.
- $n \mid a$
$\Longrightarrow a=n c$
$\Longrightarrow a b=(n c) b=n(c b)$
$\Longrightarrow n \mid a b$
- $n \mid b$
$\Longrightarrow b=n d$
$\Longrightarrow a b=a(n d)=n(a d)$
$\Longrightarrow n \mid a b$
- Hence, the proposition is true.

Proposition

- Let $n \in \mathbb{Z}$. If $n^{2}-6 n+5$ is even, then $n$ is odd.

## Proposition

- Let $n \in \mathbb{Z}$. If $n^{2}-6 n+5$ is even, then $n$ is odd.

## Proof

- Contrapositive. If $n$ is even, then $n^{2}-6 n+5$ is odd.
- $n$ is even
$\Longrightarrow n=2 a$ for some integer $a$
(defn. of even)
$\Longrightarrow n^{2}-6 n+5=(2 a)^{2}-6(2 a)+5 \quad$ (substitute $n=2 a$ )
$\Longrightarrow n^{2}-6 n+5=2\left(2 a^{2}\right)-2(6 a)+2(2)+1 \quad$ (simplify)
$\Longrightarrow n^{2}-6 n+5=2\left(2 a^{2}-6 a+2\right)+1$
$\Longrightarrow n^{2}-6 n+5$ is odd
(take 2 common)
- Hence, the proposition is true. (defn. of odd)

## Proposition

- For reals $x$ and $y$, if $x y>9$, then either $x>3$ or $y>3$.

## $x y>9 \Longrightarrow x>3$ or $y>3$

## Proposition

- For reals $x$ and $y$, if $x y>9$, then either $x>3$ or $y>3$.

Proof

- Contrapositive. If $x \leq 3$ and $y \leq 3$, then $x y \leq 9$.
- Suppose $x \leq 3$ and $y \leq 3$.
$\Longrightarrow x y \leq 9$
(multiply the two inequalities)
- Hence, the proposition is true.

## $x y>9 \Longrightarrow x>3$ or $y>3$

## Proposition

- For reals $x$ and $y$, if $x y>9$, then either $x>3$ or $y>3$.

Proof

- Contrapositive. If $x \leq 3$ and $y \leq 3$, then $x y \leq 9$.
- Suppose $x \leq 3$ and $y \leq 3$.
$\Longrightarrow x y \leq 9$
(multiply the two inequalities)
- Hence, the proposition is true.
- Incorrect! Why?

## Nonconstructive Proof

## Irrational ${ }^{\text {irrational }}$ can be rational

Proposition

- An irrational raised to an irrational power may be rational.

## Irrational ${ }^{\text {irrational }}$ can be rational

## Proposition

- An irrational raised to an irrational power may be rational.

## Proof

- We make use of the fact that $\sqrt{2}$ is irrational.

Let $x=\sqrt{2}^{\sqrt{2}}$. Number $x$ is either rational or irrational.
Case 1. If $x$ is rational, then the proposition is true.

| Irrational | Irrational | Rational |
| :---: | :---: | :---: |
| $\sqrt{2}$ | $\sqrt{2}$ | $\sqrt{2}^{\sqrt{2}}=x=$ rational |

Case 2. If $x$ is irrational, then the proposition is true.

| Irrational | Irrational | Rational |
| :---: | :---: | :---: |
| $x$ | $\sqrt{2}$ | $x^{\sqrt{2}}=\left(\sqrt{2}^{\sqrt{2}}\right)^{\sqrt{2}}=\sqrt{2}^{\sqrt{2} \cdot \sqrt{2}}=\sqrt{2}^{2}=2$ |

Proof by Contradiction

Proposition

- For all integers $n$, if $n^{2}$ is even, then $n$ is even.

## Proposition

- For all integers $n$, if $n^{2}$ is even, then $n$ is even.

## Proof

- Negation. Suppose there is an integer $n$ such that $n^{2}$ is even but $n$ is odd.
- $n=2 k+1$
$\Longrightarrow n^{2}=(2 k+1)^{2}$
$\Longrightarrow n^{2}=4 k^{2}+4 k+1$
$\Longrightarrow n^{2}=2\left(2 k^{2}+2 k\right)+1$
$\Longrightarrow n^{2}=2 m+1$
(definition of odd number)
(squaring both sides)
(expand)
(taking 2 out from two terms) (set $m=2 k^{2}+2 k$ )
( $m$ is an integer as multiplication is closed on integers)
$\Longrightarrow n^{2}=$ odd
(definition of odd number)
- Contradiction! Hence, the proposition is true.

## Greatest integer

Proposition

- There is no greatest integer.

## Greatest integer

## Proposition

- There is no greatest integer.

## Proof

- Negation. Suppose there is a greatest integer $N$.

Then $N \geq n$ for every integer $n$.
Let $M=N+1$.
$M$ is an integer since addition is closed on integers.
$M>N$ since $M=N+1$.
$M$ is an integer that is greater than $N$.
So, $N$ is not the greatest integer.
Contradiction! Hence, the proposition is true.

## $\sqrt{2}$ is irrational

Proposition

- $\sqrt{2}$ is irrational.

## $\sqrt{2}$ is irrational

## Proposition

- $\sqrt{2}$ is irrational.

## Proof

- Suppose $\sqrt{2}$ is the simplest rational.
$\Longrightarrow \sqrt{2}=m / n$
$\Longrightarrow m^{2}=2 n^{2}$
$\Longrightarrow m^{2}=$ even
$\Longrightarrow m=$ even
$\Longrightarrow m=2 k$ for some integer $k$
$\Longrightarrow(2 k)^{2}=2 n^{2}$
$\Longrightarrow n^{2}=2 k^{2}$
$\Longrightarrow n^{2}=$ even
$\Longrightarrow n=$ even
$\Longrightarrow m, n$ are even
$\Longrightarrow m, n$ have a common factor of 2
- Contradiction! Hence, the proposition is true.

## If $p \mid n$, then $p \nmid(n+1)$.

## Proposition

- For any integer $n$ and any prime $p$, if $p \mid n$, then $p \nmid(n+1)$.

## Proposition

- For any integer $n$ and any prime $p$, if $p \mid n$, then $p \nmid(n+1)$.

## Proof

- Negation. Suppose there exists integer $n$ and prime $p$ such that $p \mid n$ and $p \mid(n+1)$.
$p \mid n$ implies $p r=n$ for some integer $r$
$p \mid(n+1)$ implies $p s=n+1$ for some integer $s$
Eliminate $n$ to get:
$1=(n+1)-n=p s-p r=p(s-r)$
Hence, $p \mid 1$, from the definition of divisibility.
As $p \mid 1$, we have $p \leq 1$.
As $p$ is prime, $p>1$.
Contradiction! Hence, the proposition is true.

## \#Primes is infinite

Proposition

- The set of prime numbers is infinite.

## \#Primes is infinite

## Proposition

- The set of prime numbers is infinite.

Proof

- Negation. Assume that there are only finite number of primes.

Let the set of primes be $\left\{p_{1}, p_{2}, \ldots, p_{n}\right\}$
such that $\left(p_{1}=2\right)<\left(p_{2}=3\right)<\cdots<p_{n}$.
Consider the number $N=p_{1} p_{2} p_{3} \ldots p_{n}+1$. Clearly, $N>1$.

## \#Primes is infinite

## Proposition

- The set of prime numbers is infinite.

Proof

- Negation. Assume that there are only finite number of primes. Let the set of primes be $\left\{p_{1}, p_{2}, \ldots, p_{n}\right\}$ such that $\left(p_{1}=2\right)<\left(p_{2}=3\right)<\cdots<p_{n}$. Consider the number $N=p_{1} p_{2} p_{3} \ldots p_{n}+1$. Clearly, $N>1$. (i) There is a prime that divides $N$.

Use unique prime factorization theorem.

## \#Primes is infinite

## Proposition

- The set of prime numbers is infinite.

Proof

- Negation. Assume that there are only finite number of primes. Let the set of primes be $\left\{p_{1}, p_{2}, \ldots, p_{n}\right\}$
such that $\left(p_{1}=2\right)<\left(p_{2}=3\right)<\cdots<p_{n}$.
Consider the number $N=p_{1} p_{2} p_{3} \ldots p_{n}+1$. Clearly, $N>1$.
(i) There is a prime that divides $N$.

Use unique prime factorization theorem.
(ii) No prime divides $N$.

For all $i \in[1, n], p_{i}$ does not divide $N$ as it leaves a remainder of 1 when it divides $N$.
So, $p_{1} \not \backslash N, p_{2} \not \backslash N, \ldots, p_{n} \not \backslash N$.
Contradiction! Hence, the proposition is true.

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Proof

- Average $A=\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$
- Negation. $\forall i \in\{1,2, \ldots, n\} a_{i}<A$. That is
- We have $a_{1}<A, a_{2}<A, \ldots, a_{n}<A$

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Proof

- Average $A=\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$
- Negation. $\forall i \in\{1,2, \ldots, n\} a_{i}<A$. That is
- We have $a_{1}<A, a_{2}<A, \ldots, a_{n}<A$

Now add all these inequalities to get $\left(a_{1}+a_{2}+\cdots+a_{n}\right)<n \times A$
$\Longrightarrow A>\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$ on simplification
How is it possible that $A$ is both equal to and greater than $\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$

- Contradiction! Hence, the proposition is true.

## Average

Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Proof

- Let $a_{\text {max }}$ represent the maximum among the $n$ real numbers.
- Let average $A=\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$. Then

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Proof

- Let $a_{\text {max }}$ represent the maximum among the $n$ real numbers.
- Let average $A=\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$. Then
- $a_{1}=a_{\text {max }}-b_{1}$ such that $b_{1} \geq 0$
$a_{2}=a_{\text {max }}-b_{2}$ such that $b_{2} \geq 0$
$a_{n}=a_{\text {max }}-b_{n}$ such that $b_{n} \geq 0$

## Average

## Proposition

- If $a_{1}, a_{2}, \ldots, a_{n}$ are $n$ real numbers for natural number $n$, then at least one of these $n$ numbers is greater than or equal to the average of those $n$ numbers.

## Proof

- Let $a_{\text {max }}$ represent the maximum among the $n$ real numbers.
- Let average $A=\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n$. Then
- $a_{1}=a_{\text {max }}-b_{1}$ such that $b_{1} \geq 0$
$a_{2}=a_{\text {max }}-b_{2}$ such that $b_{2} \geq 0$
$a_{n}=a_{\text {max }}-b_{n}$ such that $b_{n} \geq 0$
Adding the above equations, we get
$\left(a_{1}+a_{2}+\cdots+a_{n}\right)=n \times a_{\max }-\left(b_{1}+b_{2}+\cdots+b_{n}\right)$
$\Longrightarrow a_{\text {max }}=\left[\left(a_{1}+a_{2}+\cdots+a_{n}\right)+\left(b_{1}+b_{2}+\cdots+b_{n}\right)\right] / n$
$=\left(\left(a_{1}+a_{2}+\cdots+a_{n}\right) / n\right)+\left(\left(b_{1}+b_{2}+\cdots+b_{n}\right) / n\right)$
$=A+\left(\left(b_{1}+b_{2}+\cdots+b_{n}\right) / n\right)$
$\geq A$

## $2^{p}-1$ is prime $\Longrightarrow p$ is prime

## Proposition

- Suppose $p \in \mathbb{N}$ and $p \geq 2$. If $2^{p}-1$ is prime, then $p$ is prime.

## $2^{p}-1$ is prime $\Longrightarrow p$ is prime

## Proposition

- Suppose $p \in \mathbb{N}$ and $p \geq 2$. If $2^{p}-1$ is prime, then $p$ is prime.

Proof

- Negation. Suppose $p$ is an integer at least 2 such that $2^{p}-1$ is prime and $p$ is composite.

## $2^{p}-1$ is prime $\Longrightarrow p$ is prime

## Proposition

- Suppose $p \in \mathbb{N}$ and $p \geq 2$. If $2^{p}-1$ is prime, then $p$ is prime.

## Proof

- Negation. Suppose $p$ is an integer at least 2 such that $2^{p}-1$ is prime and $p$ is composite.
- $p$ is composite
$\Longrightarrow p=r s$ such that both $r, s$ are in the range $[2, p-1]$
Then, $2^{p}-1$
$=2^{\text {rs }}-1 \quad$ (substitute for $p$ )
$=\left(2^{r}\right)^{s}-1 \quad\left(a^{b c}=\left(a^{b}\right)^{c}\right)$
$=\left(2^{r}-1\right)\left(\frac{\left(2^{r}\right)^{s}-1}{2^{r}-1}\right) \quad$ (multiply and divide by $\left.\left(2^{r}-1\right)>0\right)$
$=\left(2^{r}-1\right)\left(1+\left(2^{r}\right)^{1}+\left(2^{r}\right)^{2}+\cdots+\left(2^{r}\right)^{s-1}\right)$
$=m \times n$

$$
(m \geq 2 \text { and } n \geq 2)
$$

- Contradiction! Hence, the proposition is true.

## Pythagorean triplets

Proposition

- For integers $a, b, c$, if $a^{2}+b^{2}=c^{2}$, then $a$ is even or $b$ is even.

## Pythagorean triplets

Proposition

- For integers $a, b, c$, if $a^{2}+b^{2}=c^{2}$, then $a$ is even or $b$ is even.

## Proof

- Negation. $a$ and $b$ are odd and $a^{2}+b^{2}=c^{2}$.

## Pythagorean triplets

## Proposition

- For integers $a, b, c$, if $a^{2}+b^{2}=c^{2}$, then $a$ is even or $b$ is even.

## Proof

- Negation. $a$ and $b$ are odd and $a^{2}+b^{2}=c^{2}$.
- $a=2 m+1 ; b=2 n+1$
(definition of odd)
Consider $a^{2}+b^{2}$
$=(2 m+1)^{2}+(2 n+1)^{2}$
$=4 m^{2}+4 n^{2}+4 m+4 n+2$
$=4 \times\left(m^{2}+n^{2}+m+n\right)+2$
(take common factor)
$\equiv 2 \bmod 4$
(remainder is 2 when divided by 4)

## Pythagorean triplets

## Proposition

- For integers $a, b, c$, if $a^{2}+b^{2}=c^{2}$, then $a$ is even or $b$ is even.

## Proof

- Negation. $a$ and $b$ are odd and $a^{2}+b^{2}=c^{2}$.
- $a=2 m+1 ; b=2 n+1$
(definition of odd)
Consider $a^{2}+b^{2}$
$=(2 m+1)^{2}+(2 n+1)^{2}$
$=4 m^{2}+4 n^{2}+4 m+4 n+2$
$=4 \times\left(m^{2}+n^{2}+m+n\right)+2$
(take common factor)
$\equiv 2 \bmod 4 \quad$ (remainder is 2 when divided by 4)
- $c=2 k$ or $c=2 k+1$ (quotient-remainder theorem)
Consider $c^{2}$
$=4 k^{2}$ or $4\left(k^{2}+k\right)+1$
(squaring)
$\not \equiv 2 \bmod 4$
(remainder is never 2 when divided by 4)
- Contradiction! Hence, the proposition is true.

## Proof by Division into Cases

## Proposition

- There is a natural number $n$ such that $n^{2}+3 n+2$ is prime.

## Proof 2

- False!
- Negation. $\forall$ natural number $n, n^{2}+3 n+2$ is composite.

We prove the negation in two cases:

1. $n$ is even
2. $n$ is odd

## Proof 2 (continued)

1. Prove that $n$ is even $\Longrightarrow n^{2}+3 n+2$ is composite.
$n$ is even
$\Longrightarrow n^{2}$ is even and $3 n$ is even $\quad$ (even $\times$ integer $=$ even)
$\Longrightarrow n^{2}+3 n+2$ is even $\quad$ (even + even $=$ even)
$\Longrightarrow n^{2}+3 n+2$ is composite
(2 is a factor)
2. Prove that $n$ is odd $\Longrightarrow n^{2}+3 n+2$ is composite.
$n$ is odd
$\Longrightarrow n^{2}$ is odd and $3 n$ is odd
$\Longrightarrow n^{2}+3 n$ is even
$\Longrightarrow n^{2}+3 n+2$ is even
$\Longrightarrow n^{2}+3 n+2$ is composite

$$
\begin{array}{r}
(\text { odd } \times \text { odd }=\text { odd }) \\
(\text { odd }+ \text { odd }=\text { even }) \\
(\text { even }+ \text { even }=\text { even }) \\
(2 \text { is a factor })
\end{array}
$$

## Proof 2 (continued)

1. Prove that $n$ is even $\Longrightarrow n^{2}+3 n+2$ is composite.
$n$ is even
$\Longrightarrow n^{2}$ is even and $3 n$ is even $\quad$ (even $\times$ integer $=$ even)
$\Longrightarrow n^{2}+3 n+2$ is even $\quad$ (even + even $=$ even)
$\Longrightarrow n^{2}+3 n+2$ is composite
(2 is a factor)
2. Prove that $n$ is odd $\Longrightarrow n^{2}+3 n+2$ is composite.
$n$ is odd
$\Longrightarrow n^{2}$ is odd and $3 n$ is odd (odd $\times$ odd $=$ odd)
$\Longrightarrow n^{2}+3 n$ is even
$\Longrightarrow n^{2}+3 n+2$ is even
$\Longrightarrow n^{2}+3 n+2$ is composite
(odd + odd $=$ even)
(even + even $=$ even)
(2 is a factor)

## Proposition

- Use this approach to prove that for all natural number $n$, $9 n^{4}-7 n^{3}+5 n^{2}-3 n+10$ is composite.

## $\mathbf{O d d}^{2}=8 m+1$

## Proposition

- The square of any odd integer has the form $8 m+1$ for some integer $m$.

## $\mathbf{O d d}^{2}=8 m+1$

## Proposition

- The square of any odd integer has the form $8 m+1$ for some integer $m$.

## Proof

- $n$ is odd
$\Longrightarrow n=4 q$ or $n=4 q+1$ or $n=4 q+2$ or $n=4 q+3$
( $n$ can be written in one of the four forms using the quotient-remainder theorem)
But, $n \neq 4 q$ and $n \neq 4 q+2 \quad$ (as $4 q$ and $4 q+2$ are even) Hence, $n=4 q+1$ or $n=4 q+3$.
- Case 1. $n=4 q+1$.
$\Longrightarrow n^{2}=(4 q+1)^{2}=8\left(2 q^{2}+q\right)+1=8 m+1$, where $m=2 q^{2}+q=$ integer.
- Case 2. $n=4 q+3$.
$\Longrightarrow n^{2}=(4 q+3)^{2}=8\left(2 q^{2}+3 q+1\right)+1=8 m+1$, where $m=2 q^{2}+3 q+1=$ integer.

## $\left(x^{2}-y^{2}\right) \bmod 4 \neq 2$

## Proposition

- There is no solution in integers to: $\left(x^{2}-y^{2}\right) \bmod 4=2$.

## $\left(x^{2}-y^{2}\right) \bmod 4 \neq 2$

## Proposition

- There is no solution in integers to: $\left(x^{2}-y^{2}\right) \bmod 4=2$.

## Proof

- Case 1. $x$ is even and $y$ is even.
$\Longrightarrow x^{2}=4 m$ and $y^{2}=4 n$
$\Longrightarrow x^{2}-y^{2}=4(m-n)$.
- Case 2. $x$ is even and $y$ is odd.
$\Longrightarrow x^{2}=4 m$ and $y^{2}=4 n+1$
$\Longrightarrow x^{2}-y^{2}=4(m-n)-1$.
- Case 3. $x$ is odd and $y$ is even.
$\Longrightarrow x^{2}=4 m+1$ and $y^{2}=4 n$
$\Longrightarrow x^{2}-y^{2}=4(m-n)+1$.
- Case 4. $x$ is odd and $y$ is odd.
$\Longrightarrow x^{2}=4 m+1$ and $y^{2}=4 n+1$
$\Longrightarrow x^{2}-y^{2}=4(m-n)$.
- In all these four cases, $\left(x^{2}-y^{2}\right) \bmod 4 \neq 2$.

## Problems for practice

Prove or disprove the following propositions:

- If more than $n$ pigeons fly into $n$ pigeon holes for natural number $n$, then at least one pigeon hole will contain at least two pigeons. [Hint: Contradiction.]
- $1 / \sqrt{2}$ is irrational. [Hint: Contradiction.]
- $\sqrt{3}$ is irrational. [Hint: Contradiction.]
- $\sqrt{6}$ is irrational. [Hint: Contradiction.]
- $\log _{2} 3$ is irrational. [Hint: Contradiction.]
- $\log _{2} 7$ is irrational. [Hint: Contradiction.]
- For all integers $a$ and $b$, if $a b$ is a multiple of 6 , then $a$ is even and $b$ is a multiple of 3 . [Hint: Counterexample.]
- There are no integers $a$ and $b$ such that $752 b=4183-326 a$. [Hint: Contradiction.]
- $a^{n}+b^{n}=c^{n}$ has no integral solutions for all natural numbers $n \geq 1$. [Hint: Counterexample.]
- Suppose $p \in \mathbb{N}$ and $p \geq 2$. If $2^{p}-1$ is prime, then $p$ is prime. [Hint: Contraposition.]

## Problems for practice

Prove or disprove the following propositions:

- For integers $a, b, c$, if $a^{2}+b^{2}=c^{2}$, then $a$ is even or $b$ is even. [Hint: Contraposition + division into cases.]
- There are 1000 consecutive natural numbers that are not perfect squares. [Hint: Direct proof.]
- Consider any ten prime numbers that are greater than or equal to 15 . Then the sum of these prime numbers can never be (1 trillion +1 ). [Hint: Direct proof, contradiction.]
- Let $n$ be a positive integer. Prove that the closed interval $[n, 2 n]$ contains a power of 2. [Hint: Division into cases (power of 2 and not a power of 2).]

## Problems for practice

Prove or disprove the following propositions:

- Rational + rational $=$ rational. [Hint: Direct proof.]
- Rational + irrational $=$ irrational. [Hint: Contradiction.]
- Irrational + irrational $=$ rational or irrational. [Hint: Examples. $\sqrt{2}+(-\sqrt{2})=0$ and $\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}}=\sqrt{2}$.]
- Rational $\times$ rational $=$ rational. [Hint: Direct proof.]
- Rational $\times$ irrational $=$ rational or irrational. [Hint: Examples $0 \times \sqrt{2}=0$ and $1 \times \sqrt{2}=\sqrt{2}$.]
- Nonzero rational $\times$ irrational $=$ irrational. [Hint: Contradiction.]
- Irrational $\times$ irrational $=$ rational or irrational. [Hint: Examples $\sqrt{2} \times \sqrt{2}=2$ and $\sqrt{2} \times \sqrt{2}=\sqrt{6}$.]
- Rational ${ }^{\text {rational }}=$ rational or irrational. [Hint: Examples $1^{1}=1$ and $2^{1 / 2}=\sqrt{2}$.]

Bogus Proofs

## Prove $1=2$ using basic algebra

$$
\begin{array}{lr}
\hline \text { Proof } & \\
\hline \text { - } a>0, b>0 & \triangleright \text { Given } \\
\text { - } a=b & \triangleright \text { Given } \\
\text { - } a b=b^{2} & \triangleright \text { Multiply both sides by } b \\
\text { - } a b-a^{2}=b^{2}-a^{2} & \triangleright \text { Subtract } a^{2} \text { from both sides } \\
\text { - } a(b-a)=(b+a)(b-a) & \triangleright \text { Factoring } \\
\text { - } a=b+a & \triangleright \text { Divide both sides by }(b-a) \\
\text { - } 0=b & \triangleright \text { Subtract } a \text { from both sides } \\
\text { - } b=2 b & \triangleright \text { Add } b \text { to both sides } \\
\text { - } 1=2 & \triangleright \text { Divide both sides by } b \\
\text { - What is the problem with this proof? }
\end{array}
$$

## Prove $1=2$ using basic algebra

```
Proof
- \(a>0, b>0\)
- \(a=b\)
- \(a b=b^{2}\)
- \(a b-a^{2}=b^{2}-a^{2}\)
- \(a(b-a)=(b+a)(b-a)\)
- \(a=b+a\)
- \(0=b\)
- \(b=2 b\)
- \(1=2\)
```

$\triangleright$ Given
$\triangleright$ Multiply both sides by $b$
$\triangleright$ Divide both sides by $b$

- What is the problem with this proof?

## Error

- Cannot divide by 0 in mathematics
- Cannot divide by $(b-a)$ as $a=b$

## Prove $1=2$ using basic algebra

## Proof

- $n^{2}+2 n+1=(n+1)^{2}$
$\triangleright$ Expand
- $n^{2}=(n+1)^{2}-(2 n+1)$
$\triangleright$ Subtract
- $n^{2}-n(2 n+1)=(n+1)^{2}-(2 n+1)-n(2 n+1) \triangleright$ Subtract
- $n^{2}-n(2 n+1)=(n+1)^{2}-(n+1)(2 n+1) \quad \triangleright$ Factoring
- $n^{2}-n(2 n+1)+(2 n+1)^{2} / 4=$ $(n+1)^{2}-(n+1)(2 n+1)+(2 n+1)^{2} / 4$
$\triangleright$ Add
- $(n-(2 n+1) / 2)^{2}=((n+1)-(2 n+1) / 2)^{2}$
$\triangleright$ Simplify
- $n-(2 n+1) / 2=(n+1)-(2 n+1) / 2$
$\triangleright$ Square roots
- $n=n+1$
- $1=2$
$\triangleright$ Add
- What is the problem with this proof?
$\triangleright$ Subtract

## Prove $1=2$ using basic algebra

## Proof

- $n^{2}+2 n+1=(n+1)^{2}$
$\triangleright$ Expand
- $n^{2}=(n+1)^{2}-(2 n+1)$
$\triangleright$ Subtract
- $n^{2}-n(2 n+1)=(n+1)^{2}-(2 n+1)-n(2 n+1) \triangleright$ Subtract
- $n^{2}-n(2 n+1)=(n+1)^{2}-(n+1)(2 n+1) \quad \triangleright$ Factoring
- $n^{2}-n(2 n+1)+(2 n+1)^{2} / 4=$ $(n+1)^{2}-(n+1)(2 n+1)+(2 n+1)^{2} / 4$
$\triangleright$ Add
- $(n-(2 n+1) / 2)^{2}=((n+1)-(2 n+1) / 2)^{2}$
$\triangleright$ Simplify
- $n-(2 n+1) / 2=(n+1)-(2 n+1) / 2$
$\triangleright$ Square roots
- $n=n+1$ $\triangleright$ Add
- $1=2$
$\triangleright$ Subtract
- What is the problem with this proof?

## Error

- Cannot take square roots directly
- $a^{2}=b^{2}$ does not imply $a=b$
E.g.: $1^{2}=(-1)^{2}$ does not imply $1=-1$

## Prove $1=2$ using calculus

## Proof

- $\int u \mathrm{~d} v=u v-\int v \mathrm{~d} u$
$\triangleright$ Product rule
- Set $u=\frac{1}{x}$ and $v=x$; We get $\mathrm{d} u=-\frac{1}{x^{2}} \mathrm{~d} x$ and $\mathrm{d} v=\mathrm{d} x$
- $\int \frac{1}{x} \mathrm{~d} x=x \cdot \frac{1}{x}-\int x \cdot\left(-\frac{1}{x^{2}}\right) \mathrm{d} x$
$\triangleright$ Substitute
- $\int \frac{1}{x} \mathrm{~d} x=1+\int \frac{1}{x} \mathrm{~d} x$
$\triangleright$ Simplify
- $0=1$
- $1=2$
$\triangleright$ Subtract
$\triangleright$ Add
- What is the problem with this proof?

## Prove $1=2$ using calculus

## Proof

- $\int u \mathrm{~d} v=u v-\int v \mathrm{~d} u$
$\triangleright$ Product rule
- Set $u=\frac{1}{x}$ and $v=x$; We get $\mathrm{d} u=-\frac{1}{x^{2}} \mathrm{~d} x$ and $\mathrm{d} v=\mathrm{d} x$
- $\int \frac{1}{x} \mathrm{~d} x=x \cdot \frac{1}{x}-\int x \cdot\left(-\frac{1}{x^{2}}\right) \mathrm{d} x$
$\triangleright$ Substitute
- $\int \frac{1}{x} \mathrm{~d} x=1+\int \frac{1}{x} \mathrm{~d} x$
$\triangleright$ Simplify
- $0=1$
$\triangleright$ Subtract
- $1=2$
$\triangleright$ Add
- What is the problem with this proof?

## Error

- Cannot subtract integrals from both sides
- $\int \mathrm{d} x=x+$ const.
$\triangleright$ const. depends on conditions
E.g.: $\frac{\mathrm{d}}{\mathrm{d} x}(x+1)=\frac{\mathrm{d}}{\mathrm{d} x}(x+2)$ does not imply
$\int \frac{\mathrm{d}}{\mathrm{d} x}(x+1)=\int \frac{\mathrm{d}}{\mathrm{d} x}(x+2)$

## Prove $1=2$ using algebra and calculus

- $\underbrace{1+1+\cdots+1}_{x \text { times }}=2 x$
- $x=2 x$
- $1=2$
$\triangleright$ Differentiate
$\triangleright$ Simplify
$\triangleright$ Divide
- What is the problem with this proof?

## Error

- Cannot write $\underbrace{x+x+\cdots+x}_{x \text { times }}=x^{2}$ for non-integers
- E.g.: Cannot write $\underbrace{1.5+1.5+\cdots+1.5}_{1.5 \text { times }}=1.5^{2}$

## Prove $1=2$ using continued fractions

$$
\begin{aligned}
& \text { Proof } \\
& \text { - } 1=\frac{2}{3-1}=\frac{2}{3-\frac{2}{3-1}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-1}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-1}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-\cdots}}}}} \begin{array}{l}
\text { - } 2=\frac{2}{3-2}=\frac{2}{3-\frac{2}{3-2}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-2}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-2}}}}=\frac{2}{3-\frac{2}{3-\frac{2}{33-\ldots}}}
\end{array}
\end{aligned}
$$

- $1=2 \quad \triangleright$ Continued fractions are the same
- What is the problem with this proof?

## Prove $1=2$ using continued fractions

## Proof

- $1=\frac{2}{3-1}=\frac{2}{3-\frac{2}{3-1}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-1}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-1}}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-\cdots}}}}$
- $2=\frac{2}{3-2}=\frac{2}{3-\frac{2}{3-2}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-2}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-2}}}}=\frac{2}{3-\frac{2}{3-\frac{2}{3-\frac{2}{3-\ldots}}}}$
- $1=2 \quad \triangleright$ Continued fractions are the same
- What is the problem with this proof?

## Error

- Cannot equate the values of the continued fractions
- The given continued fraction is $x=\frac{2}{3-x}$

Solving for $x$, we have $x=1$ or $x=2$

- Beware of infinity!

## Prove $1=2$ using infinite series

## Proof

- Consider Grandi's series $S=1-1+1-1+\cdots$
- $S=(1-1)+(1-1)+\cdots=0+0+\cdots=0$
- $S=1+(-1+1)+(-1+1)+\cdots=1+0+0+\cdots=1$
- $0=1$
$\triangleright S=0$ and $S=1$
- $1=2$
$\triangleright$ Add
- What is the problem with this proof?

## Prove $1=2$ using infinite series

## Proof

- Consider Grandi's series $S=1-1+1-1+\cdots$
- $S=(1-1)+(1-1)+\cdots=0+0+\cdots=0$
- $S=1+(-1+1)+(-1+1)+\cdots=1+0+0+\cdots=1$
- $0=1$
$\triangleright S=0$ and $S=1$
- $1=2$
$\triangleright$ Add
- What is the problem with this proof?

## Error

- Cannot use several algebraic methods on a divergent series
- Grandi's series is divergent
- Beware of infinity!

## Prove $1=2$ using set theory

## Proof

- Using Georg Cantor's set theory and his idea of one-to-one correspondence, we can show that the number of points on the number line segment $[0,1]$ is same as the number of points on the number line segment $[0,2]$
- $1=2$
- What is the problem with this proof?

## Prove $1=2$ using set theory

## Proof

- Using Georg Cantor's set theory and his idea of one-to-one correspondence, we can show that the number of points on the number line segment $[0,1]$ is same as the number of points on the number line segment $[0,2]$
- $1=2$
- What is the problem with this proof?

## Error

- Solution is out of scope
- The problem is because the principles that apply in the world of finite quantities do not apply in the world of infinite quantities
- Beware of infinity!

## Prove $1=2$ using geometry

## Proof

- Banach-Tarski paradox states that a solid ball can be split into a finite number of disjoint subsets, which can then be assembled to create two identical copies of the original solid ball

- $1=2$
- What is the problem with this proof?

## Prove $1=2$ using geometry

## Proof

- Banach-Tarski paradox states that a solid ball can be split into a finite number of disjoint subsets, which can then be assembled to create two identical copies of the original solid ball

- $1=2$
- What is the problem with this proof?

## Error

- Solution is out of scope
- The problem is because the principles that apply in the world of finite quantities do not apply in the world of infinite quantities
- Beware of infinity!
- History. The theorem first appeared in a Babylonian tablet dated 1900-1600 B.C.
- Incorrect proofs. Alexander Bogomolny's website Cut-The-Knot https://www.cut-the-knot.org/pythagoras/FalseProofs.shtml presents 9 incorrect proofs of the theorem
- Correct proofs. Elisha Scott Loomis' book "The Pythagorean Proposition" presents 367 correct proofs of the theorem (algebraic proofs + geometric proofs + trigonometric proofs)
- More Proofs. An infinite number of algebraic and geometric proofs exist for the theorem (Proof?)
