Strassen's Algorithms for Matrix Multiplication (MM)

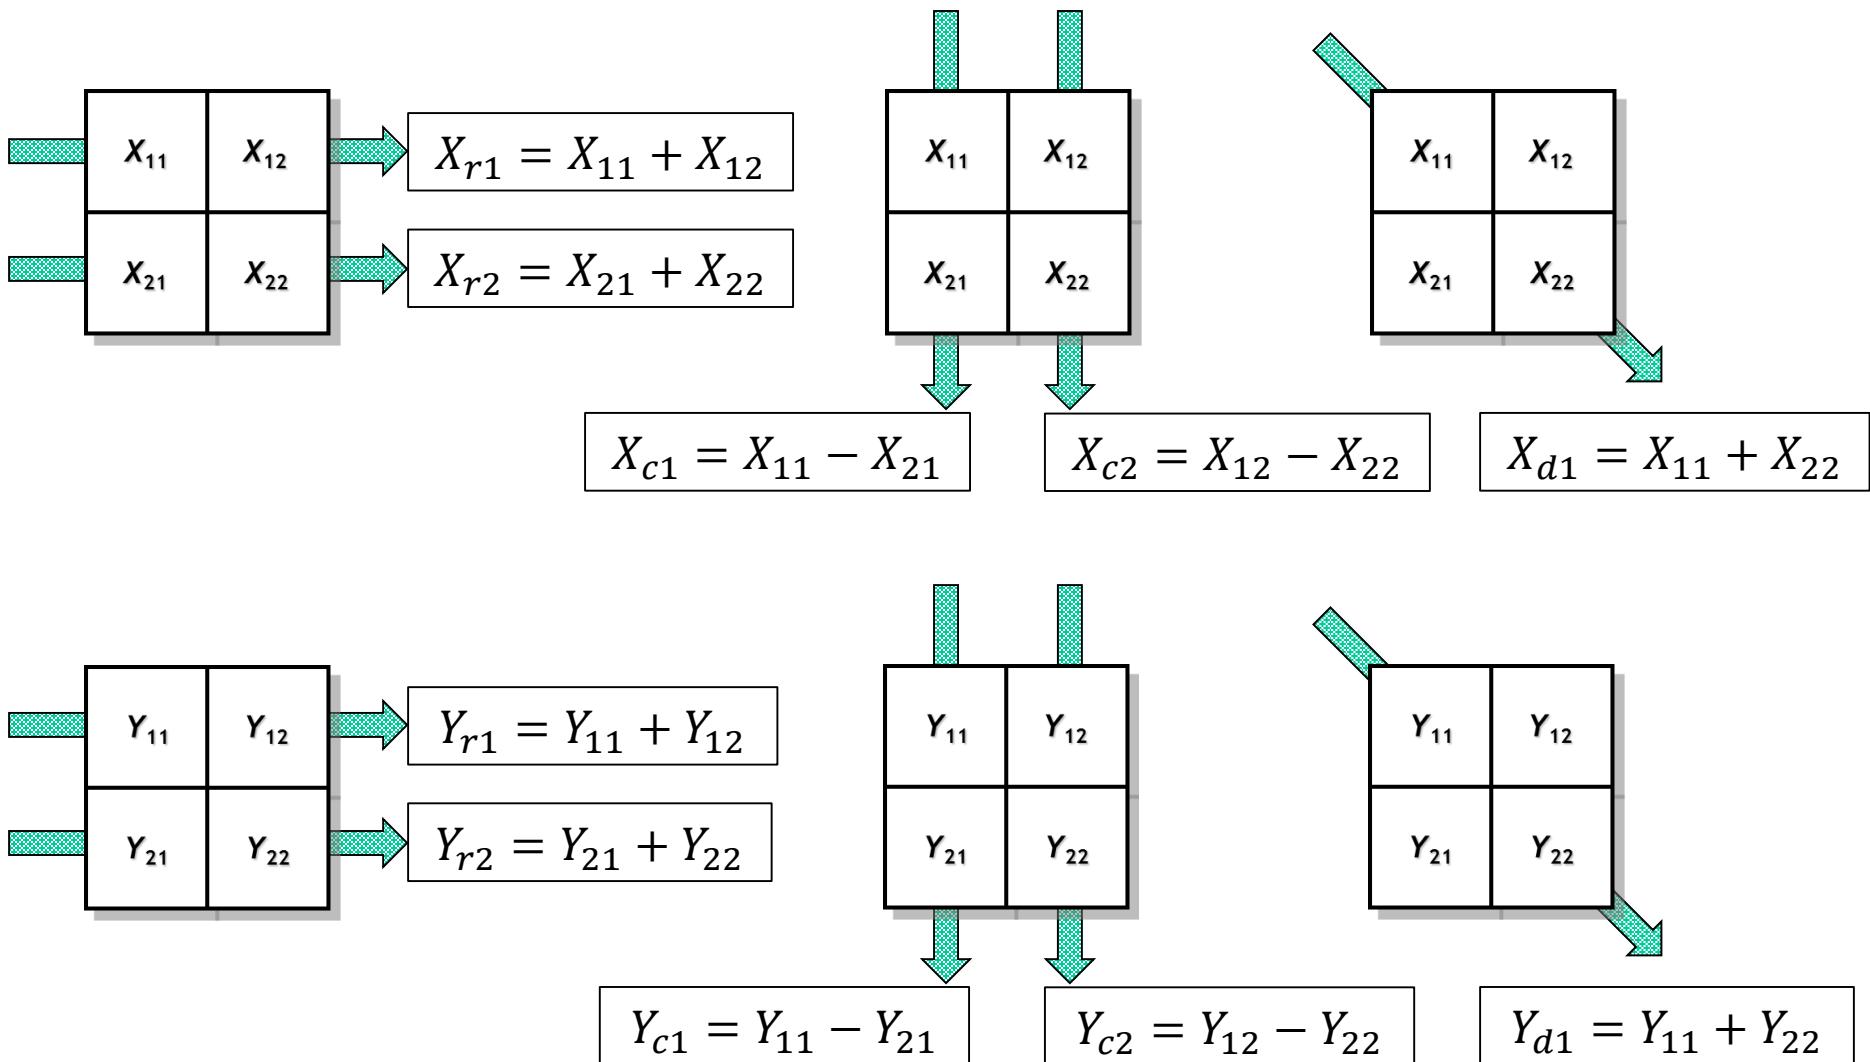

In 1968 Volker Strassen came up with a recursive MM algorithm that runs asymptotically faster than the classical $\Theta(n^3)$ algorithm.

In each level of recursion the algorithm uses:

7 recursive matrix multiplications (instead to 8), and
18 matrix additions (instead of 4).

We will try to minimize the number of multiplications needed to evaluate Z using special matrix products that are easy to compute.

Algorithms for Multiplying Two $n \times n$ Matrices

A recursive algorithm based on multiplying two $m \times m$ matrices using k multiplications will yield an $O(n^{\log_m k})$ algorithm.

To beat Strassen's algorithm: $\log_m k < \log_2 7 \Rightarrow k < m^{\log_2 7}$.

So, for a 3×3 matrix, we must have: $k < 3^{\log_2 7} < 22$.

But the best known algorithm uses 23 multiplications!
